Duties

THE DEMING COMPANY
SALEM, OHIO, U.S.A.

ESTABLISHED 1880

The "World's Best" Equipped Pump Factories

The above bird's-eye views represent the plants of The Deming Company, where are produced the "World's Best" Hand and Power Pumps for all Uses. The upper view shows the Main Plant (Works No. 1), in which are made the Hand, Windmill and Power Pumps—the large Triplex and Deep Well Power Pumps and Hydraulic Machinery are made in building at the right. The lower view, in oval panel, shows the department of Spray Pumps, Nozzles and Accessories (Works No. 2), in which also are produced brass goods entering into the Deming lines.

ANNOUNCEMENT

THIS edition of our General Catalogue is ready for distribution in the beginning of our forty-first year as Pump Manufacturers. In March, 1880, our first pump patterns were ready for the foundry—a number two cistern and a pitcher spout pump, some millions of which have subsequently been turned out from our factory and shipped to all parts of the world. These two simple types were soon followed by set-length pumps and the common types of well and windmill standards and cylinders. Each year the line was increased in variety and volume of product until now there is hardly a pumping condition that is not met by some one of the many pumps made in the Deming factory, embracing a great variety of types, and sizes, for various uses, from the smallest Hand Pump to the most ponderous Power Pump.

Deming Pumps are designed for durability and efficiency by expert engineers and are made of the best materials by experienced mechanics. Modern Machine Tools of the best makes are used, the equipment in our various manufacturing departments being the best obtainable. For the convenience of dealers we issue, in addition to this General Catalogue, separate departmental catalogues, booklets and circulars; principally our Power Pump Bulletins, Spray Pump Catalogue, and Hydro-Pneumatic Water Supply Catalogue.

The division into distinct chapters or sections, each embracing a class of Pumps, or Accessories, we believe will be appreciated, as this arrangement enables one by referring to the Table of Contents to easily and quickly find the page on which the Pump or other article is shown. In addition to this general Table of Contents and the division into classified chapters we have the usual Figure Index and the Alphabetical Index. The Engineering Tables and Information relating to Hydraulics, and the Telegraph Cipher Code are useful to the dealer in Pumps.

In this Catalogue No. 26, we have eliminated certain pumps that are superseded by similar more recent productions. Every pumping requirement is, however, met by the articles shown herein.

Read carefully and take note of the following

EXPLANATIONS AND INSTRUCTIONS

CORRESPONDENCE

In order to insure prompt replies to communications, all letters should be addressed to the Company and not to individuals. Orders should be specific—mention of the Figure and Number or Size, and the Fitting only being necessary. *Please do not mutilate this Catalogue.*

PRICES AND TERMS

Prices are given to the trade in discount sheets with exception of Triplex and Deep Well Power Pumps which are quoted on application. Trade prices and special quotations are subject to change without notice. Parties not known to us commercially should accompany their orders with cash, or with satisfactory reference. Orders are accepted contingent upon unavoidable delays.

HAND AND POWER PUMPS FOR ALL USES

EXPLANATIONS AND INSTRUCTIONS—Continued

ORDERS AND SHIPMENTS

Unless otherwise specified in the order, we will ship by freight, delivery being made F. O. B. cars at factory, except in cases where such shipment had best be made by express or parcel post; and unless specifically mentioned we will in such cases use our judgment. In ordering, the Figure and Number or Size should be specified. We pay particular attention to properly packing goods for exportation and we maintain an export office in New York City.

ESTIMATES AND RECOMMENDATIONS

Prospective purchasers will be given estimates on pumping outfits and recommendations as to what is adaptable. This applies particularly to Power Pumping Outfits, Hydro-Pneumatic Water Supply Systems, Hydraulic Rams and Power Spraying Outfits. Special designs and adaptations of power pumps will be made, under agreement, for certain purposes and to meet special requirements.

SOME POWER PUMPS NOT SHOWN

Our line of Triplex and Deep Well Power Pumps is not complete in this catalogue; only the principal types being shown. The complete line is covered by individual Power Pump Bulletins. The list prices of many Power Pumps illustrated herein are omitted but will be quoted on application.

RETURNED GOODS

Pumps and other goods that are returned will not be accepted unless arrangements for their return have been previously made. Always mark your name and address distinctly on the package when returning goods, and send us by mail a memorandum of the same with bill of lading.

ALLOWANCE OF CLAIMS

All claims for corrections or deductions should be made within ten days after receipt of the goods. We are not responsible for breakages after goods are delivered to the transportation company in good condition.

INSPECTION AND TESTING

We take great care in inspecting Deming Pumps as to material and workmanship so that defects are very rare. All Power Pumps are tested in the factory. Charges for labor or expense required to repair defective goods will not be allowed. The amount of damage allowed in such case is only the price of the defective goods, which should be returned to us.

ILLUSTRATIONS AND IMPROVEMENTS

As we are constantly making improvements in design and construction of Deming Pumps, the goods ordered, when received, may possibly not be exactly like the engravings in the catalogue. In our old catalogues are shown certain articles not illustrated in later editions. On receipt of specific description, the repairs for such goods may usually be procured from us.

DISTRIBUTING AGENCIES

In the principal cities we have Distributing Agencies for handling Deming Hand and Power Pumps and Water Systems. These agencies have been established for the convenience of dealers in the adjacent territory.

IN CONCLUSION

This catalogue is self-explanatory and is arranged to save unnecessary correspondence. It supersedes all former issues of our General Catalogue. The List and Trade Prices are subject to change without notice.

Each Chapter or Classified Section embraces the Pumps or other articles which are related to each other in their most essential points.

When the Figure number of an article is known the same may be found by referring to the Figure Index; and if the name of the article is known it may be found by referring to the Alphabetical Index; both contained in the last chapter of this catalogue.

TITLE OF SECTIONS

	PAGES
HOUSE LIFT AND FORCE PUMPS	9 to 28
Pitcher Spout and Cistern Lift Pumps for Shallow Wells and Cisterns.	
House Force Pumps for Hand Use in Domestic Water Supply.	
SET LENGTH LIFT AND FORCE PUMPS	29 to 48
Non-Freezing Outdoor Pumps for Shallow Wells and Cisterns. Complete Lift and Force Pumps for Hand and Windmill Use with Three-Foot Set-Length between Standard and Cylinder.	
WELL AND WIND MILL PUMP STANDARDS	49 to 68
Lift and Force Pump Standards, Stuffing-box Heads, etc., for either Shallow or Deep Wells; the Cylinder or Working Barrel being separate and usually submerged.	
"STRAIGHT LINE" PUMPS AND WORKING HEADS.	69 to 76
For Shallow or Deep Wells. May be Operated by Hand, Windmill, Gasoline Engine or Electric Motor; the Cylinder or Working Barrel in most cases being separate and usually submerged.	
CYLINDERS AND PUMP LEATHERS	77 to 94
Iron, Brass and Brass-lined Cylinders, Used with Hand and Windmill Lift and Force Standards, Power Working Heads, etc. For general water supply; the Cylinder being usually submerged.	
PIPE, SUPPLIES AND PUMP FIXTURES	95 to 110
Strainers, Float, Check and Foot Valves; Air Chambers, Pump Rod and Couplings, Drive Points, Pipe and Fittings, Sinks, Brass Goods, Hose, Pump Fitters' Tools, Oil and Grease Cups, etc.	
MISCELLANEOUS HAND AND POWER PUMPS	111 to 136
Pumps for the Farm and Factory, Garage, Plumbing Shop, etc., including Thresher Tank Pumps, Contractors' Pumps, Bilge Pumps, Plumbers' Pumps, Factory and Village Fire Pumps, Air Compressors, Hydraulic Rams, Test Pumps, Creamery Pumps, Pump Jacks, etc.	

HAND AND POWER PUMPS FOR ALL USES

TITLE OF SECTIONS—(Continued)

CENTRIFUGAL AND ROTARY PUMPS	137 to 150
Hand and Power Rotary Pumps for Use in Oil Refineries, Creameries, Breweries, Canning Factories, Paint and Chemical Works, etc., also Horizontal and Vertical Centrifugal Power Pumps for Contractors' Use, Draining and Irrigating, etc.	
TRIPLEX POWER PUMPS, SINGLE AND DOUBLE-ACTING.	151 to 162
For Boiler Feeding, Mine Pumping, Water Works, Sewage Pumping, Brine Circulation, Paper Mill Pumping, Hydraulic Pressure Accumulators, Fire Protection Service, Railway Water Supply, Hydraulic Elevator Service, Private Water Supply, Irrigating, etc., for Operation by Electric or Other Power.	
HORIZONTAL DOUBLE-ACTING POWER PUMPS	163 to 174
Double-Acting Power Pumps for Various Duties Operated from any Power Source for Mine Pumping, Contractors' Use, Water Tank Service in Factories and Mills, Pneumatic Tank Service, etc.	
DEEP WELL WORKING HEADS	175 to 186
For Use with Brass Artesian Well and Other Types of Cylinders. For Operation by Electric Motor, Gas or Gasoline Engine, Steam Engine, Horse Power and Windmill; Using Belt, Gearing or Connecting Rod.	
HYDRO-PNEUMATIC WATER SYSTEMS	187 to 198
For Supplying Water to Farm Homes, Suburban Residences, Country Clubs, Summer Homes, Greenhouses, etc., the Tank Pressure in Many Cases being Automatically Controlled, and the Pump Operated by Electric Motor, Gasoline Engine or by Hand.	
SPRAY PUMPS AND ACCESSORIES	199 to 216
Bucket, Knapsack, Barrel, Tank, Compressed Air, and Cart Sprayers for the Garden, Greenhouse and Orchard; Independent Power Spray Pumps and Complete Power Spraying Outfits for Extensive Operations; Field Sprayers, Spray Nozzles, Spraying Attachments, etc.	
REPAIRS OR EXTRA PARTS	217 to 238
Descriptive Tabulated Price Lists of Extra Parts for Deming Hand, Windmill and Power Pumps; Iron and Brass Cylinders, Spray Pumps and Accessories.	
TECHNICAL DATA AND ENGINEERING TABLES	239 to 248
Information for the Engineer, Architect and Manufacturer; Also for Dealers In and Users of Pumps in General; Such as Facts, Formulas and Rules Relating to Hydraulics and Pneumatics; Including Capacities, Power and Speed of Pumps, and Their Operating Factor.	
TELEGRAPH CIPHER CODE AND INDEXES	249 to 254
Embracing Figure Index Arranged by Figure Numbers, Consecutively; and Alphabetical Index Arranged by Name of Article. The Telegraph Cipher Code Defines Sentences Relating to Class of Goods, Inquiries and Prices, Terms and Shipments; Also to Orders and their Execution.	

HOUSE LIFT *AND* FORCE PUMPS

FOR CISTERNS AND WELLS

PITCHER SPOUT AND CISTERN
LIFT PUMPS FOR SHALLOW
WELLS AND CISTERNS. HOUSE
FORCE PUMPS FOR HAND USE
IN DOMESTIC WATER
SUPPLY.

A Typical Deming House Force Pump

Fig. 508

(Descriptive Illustration)

The names of the various parts are indicated in the illustration to give dealers and users a general idea of the component parts of pumps shown in this section or chapter of the catalogue. These pumps are complete integral force pumps ready for attaching of suction and discharge tubing.

The pumps designated as house force pumps will satisfactorily lift water by suction a vertical distance of 25 ft. calculated from the surface of the water to the pump cylinder. A reasonable horizontal distance from the water supply to the cylinder does not materially affect the working of the pump, but all pipe connections should be screwed up tight and the horizontal part of suction pipe should always incline a trifle upward toward the pump. This will prevent air pockets, which are troublesome.

With a house force pump water can be lifted and forced to a point above the surface of supply, (called the total lift) from a cistern, well, spring, dam or creek, as given below for various dimensions of cylinder.

Approximate Duty of House Force Pumps

(The Leverage Being About 6 to 1)

Diameter of Cylinder Inches	Stroke Inches	Capacity per Stroke Gallons	Will Lift and Force Feet
2	6	.0816	90
2½	6	.1275	75
3	6	.1836	50
3½	8	.3332	35
4	8	.4352	30

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

How to Install Deming House Lift and Force Pumps

Shown on the Following Pages

Typical Installation showing well a horizontal distance from pump

suction distance does not exceed 25 feet. This is illustrated by the "Typical Installation" in which the water is drawn vertically from the well, then horizontally to a point beneath the pump, and again vertically into the pump cylinder which is located in the stock or body of the pump. When the suction pipe is laid horizontally, it should be placed underground a distance of three feet to prevent freezing, and the pipe leading vertically to the pump should be carefully boxed in for the same reason.

Where the water is more than 25 feet below the pump, Deming Set-Length Pumps, with additional pipe, or Deming Well Pump Standards should be used.

Before placing the pump in working position, it is best to soak the stock in water for an hour or so. This will expand the cup leather and cause it to fit the walls of the cylinder more snugly. The pump should always rest firmly on the well curb or platform, and should not be supported by the suction pipe. The lower end of the suction pipe should never be permitted to touch the bottom of the well.

The pump always works easier after a few days' use. If the plunger leathers should be thick, the pump may work hard and stiff at first. It is almost impossible to adjust leathers exactly right at the factory because of the difference in expansion and thickness of the leathers.

All pipe joints should be well threaded and screwed together snugly so as to secure a perfect suction. The connecting rod in deep well pumps should be well threaded and screwed together tightly to make good, strong joints.

If a bucket of water is held to the spout and the handle is worked rapidly, the pump will prime itself.

It is possible to draw water horizontally any reasonable distance, provided the vertical

Deming Close Top Pitcher Spout Pump

With Adjustable Lever and Cut-Off Base
For a Vertical Suction Lift of 25 Feet

Fig. 125

This is our Fig. 125 improved pitcher spout pump with close top. It is in universal favor for house use, where a low priced but substantial cistern pump is required. Fig. 125 has a cut-off base so that a bucket or vessel when set under the spout, will catch the water.

The cylinder is polished on a special machine which insures a smooth surface for the plunger and at the same time leaves intact the chilled face of the casting. All parts are made to exact gauges so that repairs will always fit. An iron valve seat is regularly furnished. Brass valve seat instead of iron, will be furnished if desired, but at extra cost.

On the projecting hub at the bottom of the base, is screwed a coupling nut which is threaded for iron pipe. When so ordered, either a brass tube or a galvanized iron tube for soldering to lead pipe, will be furnished, but at extra charge. Fig. 125 is made with either iron or brass-lined cylinder as listed below.

Furnished, when so ordered, with Brass Valve Seat at extra cost.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

The Deming "Domestic" Kitchen Pump

With Close Top

For Vertical Suction Lift of 25 Feet

Fig. 102

This is a splendid pump for kitchen use. The close top and large water chamber prevent the water from splashing out at the top. A spout of this type keeps the water from dripping back on the pump stand. The "horn" on the spout provides a means of supporting the bucket. By unscrewing the two bolts in the bearer, the lever can be swung around to the right or left as desired.

The "Domestic" is very durable. It is not expensive and is a staunch and efficient pump for cistern use. The cylinder is iron. On the projecting hub at the bottom of the base, is screwed a coupling nut which is threaded for iron pipe. If specified, a brass or galvanized iron tube for soldering to lead pipe will be supplied at extra cost. All parts are made to exact gauges so repairs will always fit.

Furnished, when so ordered, with Brass Valve Seat at extra cost.

Sizes and Prices

Deming Brass Cylinder Pitcher Spout Pumps

With Close Top and Adjustable Lever
For Vertical Suction Lift of 25 Feet

Fig. 101

Fig. 115

These pumps have the cylinder or stock constructed of SEAMLESS BRASS TUBING which makes them extremely durable. On the projecting hub at the bottom of the base, is screwed a coupling nut which is threaded for iron pipe. If so ordered, a brass or galvanized iron tube for soldering to lead pipe will be supplied at extra cost.

Fig. 101 can be furnished with either nickel plated or brass finished cylinder as listed below.

Fig. 115 has all-brass plunger.

The bearers may be set at any angle to the spout. The construction of the bases makes it possible to place a vessel directly beneath the spout.

Wherever a cistern pump of neat appearance and high quality is desired, either Fig. 101 or Fig. 115 will fulfill the requirements in every respect.

Brass Valve Seats are regularly furnished on these pumps.

Deming Revolving Top Cistern Pumps With Bolted Base and Polished Cylinder For Vertical Suction Lift of 25 Feet or Less

Fig. 120

Detail View of
Base Furnished on
These Pumps

Fig. 124. With Wall Brackets

These pumps have the cylinder in the stock and are ready to use when connected to pipe. The cylinder is bolted to the base. The top is held in place by a set screw so that the lever may be swung around to any desired position.

The cylinder is water polished up to the spout, which prevents wear on the pump leather and insures a good suction.

The base on these pumps is tapped for iron pipe as listed below. When so ordered, tubes for soldering to lead pipe will be furnished at extra price.

Fig. 124 is identical with Fig. 120 except that it is fitted with brackets for attaching to plank or wall.

*For export, when so ordered, we fit these pumps for English pipe thread.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Special Cistern Force Pumps

With Brass Cylinder
Will Lift and Force 50 Feet

Fig. 518

Fig. 519

The above cuts represent a type of our more recent cistern force pumps with Brass cylinder. They will be found useful in elevating water to bathroom, tank or any part of the house by running pipes from the back outlet. We furnish this pump with either plain or cock Spout and with or without air chamber. The long swinging fulcrum (on Figs. 518 and 519) reduces the wear on plunger rod and stuffing box to a minimum. These pumps can be fitted for lead or iron pipe, but always furnished for iron pipe unless otherwise specified.

In ordering, always state style of spout. For Nickel-plated Cylinders add \$1.00 to list.

Brass Valve Seats are regularly furnished on these pumps.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming "New Era" Double-Acting House Force Pumps With Differential Plunger Will Lift and Force from 35 to 50 Feet

Fig. 540

Fig. 544

For house use these are very popular pumps to lift and force water from cisterns and shallow wells where the water is within easy vertical suction distance. If water is to be discharged into an elevated tank, Fig. 544 must be used, because it has a cock spout adapting it especially to this purpose.

The suction plunger below the spout, and the differential plunger above the spout produce a double acting effect as the suction plunger is twice the area of the differential.

On the projecting hub at the bottom of the base, is screwed a coupling nut which is threaded for iron pipe. When so ordered a brass tube or galvanized iron tube for soldering to lead pipe, will be furnished at additional cost.

The spouts are threaded for $\frac{3}{4}$ -inch hose coupling. The back outlet is tapped for 1-inch pipe. The bearers are adjustable so the levers can be turned at any angle with the spout. By removing the brass plug in the air chamber, Figs. 540 and 544 may be converted into lift pumps.

Brass Valve Seats are regularly furnished on these pumps.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Hand Force Pump on Base

With Cock Spout and Air Chamber
Will Lift and Force 35 to 75 Feet

Fig. 508

This is an extremely popular pump. It has an air chamber and cock spout on the side discharge. The upward discharge is supplied with a union nut and galvanized malleable iron tube threaded for pipe as listed. Brass cased plunger rod is regularly furnished.

The base is tapped for iron suction pipe. All parts are made to exact gauges and repairs will always fit.

The bearer is adjustable to any angle with the spout. The bolt holes in the air chamber are so spaced that the spout can be turned 90 degrees in either direction.

To prevent freezing, raise the lever to extreme height.

If upward discharge ONLY is to be used, deduct \$2.50 for cock spout from list price.

Brass Valve Seat is regularly furnished on this pump.

Deming Hand Force Pump on Plank

With Cock Spout and Upward Discharge
Will Lift and Force 35 to 75 Feet

Fig. 509

The pump here illustrated is in every respect similar to Fig. 508, shown on opposite page, except that it is provided with brackets for attaching to plank or wall.

The upward discharge is supplied with a union nut and galvanized malleable iron tube threaded for pipe as listed.

Base is tapped for iron pipe as listed below. When so ordered, tubes for soldering to lead pipe will be furnished at extra price.

The bolt holes in the air chamber are so spaced that the spout can be turned 90 degrees in either direction. Brass cased plunger rod is regularly furnished. All parts are made to exact gauges so that repairs will always fit.

Should the plank not be desired, deduct \$1.00 list.

If cock spout is not desired, deduct \$2.50 from list price.

Deming "Blue Special" House Force Pump

With Brass Tube Cylinder
Will Lift and Force 50 Feet

Fig. 516

This is one of our latest and best designed pumps for house use. It has a long swinging fulcrum which puts on the base, all the strain of pumping. The suction pipe screws into the base. This type of bolted base is very convenient to install and makes the suction valve easy of access when the cylinder is removed from the base.

Fig. 516 has brass tube cylinder and large air chamber, also compression bibb cock and a back outlet tapped for one inch pipe. The plunger rod is brass cased and operates through a brass stuffing box gland. Fig. 516 is painted blue and gold and presents a very neat appearance. The unusually long lever makes pumping easy.

Brass Valve Seat is regularly furnished on this pump.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming House Force Pump on Plank

With Fly-Wheel and Crank

Will Lift and Force 35 to 75 Feet

Fig. 523

This pump is firmly bolted to the wall plank. The spout can be set at different angles by removing the bolts in the base of the air chamber.

The fly-wheel is 20 inches in diameter and will be found of great assistance in pumping large quantities of water.

The plunger rod is brass cased and operates through a brass stuffing box gland.

The upward discharge is supplied with a union nut and galvanized malleable iron tube threaded for pipe as listed.

Base is tapped for iron pipe as listed below. When so ordered, tubes for soldering to lead pipe will be supplied at extra cost.

The plank on which the pump is mounted is nicely finished in natural wood. Deduct \$1.00 from list price if plank is not desired.

If cock spout is not desired, deduct \$2.50 from list price.

Brass Valve Seat is regularly furnished on this pump.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming House Force Pump on Plank With Upward Discharge Will Lift and Force 35 to 75 Feet

Fig. 520

Fig. 520 has a brass cased piston rod with pitman and rod guide, and long lever. The lever is furnished for either right or left hand, but is always arranged right handed, as illustrated, unless otherwise ordered.

All parts are made to exact gauges so that repairs will always fit.

The discharge of Fig. 520 is fitted with a galvanized malleable iron tube threaded for iron pipe, this tube being attached to the discharge funnel with a coupling nut.

Base is tapped for iron pipe as listed below. When so ordered, tubes for soldering to lead pipe will be supplied at extra cost.

Fig. 520 is regularly mounted on a handsome plank and presents a very fine appearance. If this plank is not desired, deduct \$1.00 list.

Brass Valve Seat is regularly furnished on this pump.

Deming House Force Pump on Plank

With Air Chamber and Cock Spout
Will Lift and Force 35 to 75 Feet

Fig. 524

In all respects this is the same pump as Fig. 520, except that an air chamber and cock spout have been added. The bolt holes in the air chamber are so spaced that the spout can be turned 90 degrees.

The upward discharge is supplied with a union nut and galvanized malleable iron tube threaded for pipe as listed.

Base is tapped for iron pipe as listed below. When so ordered, tubes for soldering to lead pipe will be supplied at extra cost.

All parts are made to exact gauges so that repairs will always fit.

Should plank not be desired, deduct \$1.00 list.

Deduct \$2.50 from list price if cock spout is not wanted.

Brass Valve Seat is regularly furnished on this pump.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming "Ideal" Double-Acting Oscillating Force Pump

With Brackets

Will Lift and Force 20 to 90 Feet

Fig. 570

Fig. 570 is well suited for pumping hot liquid, oils, wines, cider, etc., as it has no leather packing.

To secure the best results, the vertical distance from the pump to the liquid should not exceed 20 feet. A foot valve on the end of the suction pipe may be used to advantage where freezing is not liable to occur. The pump lever may be worked from either a vertical or horizontal position. The construction of Fig. 570 is such as to cause a minimum of friction. All parts are made to exact gauges so that repairs will always fit. The following parts are regularly made of brass:

Oscillating wing or piston, valves, which are brass swing type, suction valve deck and valves, stuffing-box gland.

Following are the parts regularly made of iron, any or all of which will be made of brass when specified at extra cost:

Shell, lid, stuffing-box nut and pipe flanges.

The piston shaft is steel but will be made of brass if specified, but at extra cost. Lever is regularly malleable iron but can be furnished with an iron socket and wood lever if so specified. The interior view shown on opposite page will explain the construction, also method of operation.

We can furnish air chamber with cock spout at additional list prices as on opposite page.

Deming "Climax" Double Acting House Force Pumps

For Open Tank Water Systems
Will Lift and Force 50 to 75 Feet

Fig. 608

These are two of our most popular pumps for elevating water to upper floors and attic tanks. Access to the valves is obtained by removing the two bolts, one on each end of the pump. The air chamber and suction attachment can then each be separated from the valve chamber, leaving the valves exposed. As shown in the illustration, the valve chamber is cast on the side of the cylinder. Both cylinder heads are bolted on, making the plunger easily accessible.

Water is discharged on both strokes and a steady even stream is insured because of the large air chamber. Figs. 608 and 600 are especially

Fig. 600

suited to *open tank* water systems. For pumps to be used with the hydro-pneumatic (compressed air tank systems) see next page. All "Climax" pumps have bronze wing valves and bronze valve seats. Many thousand "Climax" pumps are now in use.

Fig. 600 is fitted with cog lever. In this respect only does it differ from Fig. 608 which has plain lever.

Deming "Climax" Double Acting House Force Pumps

For Hydro-Pneumatic Systems
Will Lift and Force 50 to 75 Feet

Fig. 608½

With Air Cock and Plain Lever

Except that to each of these pumps is fitted a small check valve and air cock, they are identical with Figs. 608 and 600 shown on the opposite page. This air valve which is attached to the cylinder head, adapts these pumps for use with hydro-pneumatic systems of water supply (commonly known as compression tank water systems).

The hydro-pneumatic systems are fully explained on pages 187 to 198. With the air cock just mentioned the amount of air to be pumped into the tank with the water, can be easily governed by adjusting the cock. If it is desired to

Fig. 600½

With Air Cock and Cog Lever

pump water only, then the air cock can be shut off. Fig. 600½ "Climax" is the Fig. 608½ "Climax" with cog lever instead of plain lever.

Deming Double-Acting House Force Pump

For Hydro-Pneumatic Service

For Wells and Cisterns 25 Feet Deep or Less

Fig. 606

Fig. 606, with Patented Internal Air Cylinder

Section of Fig. 606
(Patented)

In general construction, this pump is similar to those illustrated and described on the two preceding pages. It is, however, fitted with a special internal air cylinder which is connected directly to the air chamber or compression tank as desired, by an air discharge pipe. With this device, air is not taken directly into the suction; therefore the efficiency of the pump is not impaired. The piston rod is hollow and forms the internal air cylinder. If water only is desired, close the air cock on plunger rod. THIS INTERNAL AIR CYLINDER IS FULLY COVERED BY OUR PATENTS. The view of this pump in section shows clearly the method of operating.

FIG. 606 IS ESPECIALLY ADAPTED FOR USE WHERE THE SUPPLY IS HIGHER THAN THE PUMP, but can also be used to good advantage where the supply is lower than the pump.

FIG. 606 is, without doubt, the most efficient hand pump on the market for hydro-pneumatic systems.

Deming Set Length Lift and Force Pumps

Suggestions For Installing Them

Any pump stock which is connected to an independent cylinder by sufficient pipe to place the top of the cylinder three feet below the base of the pump, is known as a "Set Length pump." By the use of this fixed set length, the cylinder is brought below the frost line. All the pumps illustrated in this section are furnished with a three-foot set length and a cylinder.

To prevent freezing, we drill a small hole in the set length pipe just above the cylinder, which permits the water to drain out of the pipe after pumping. Care should be taken that this drip hole does not become clogged while the pump is being installed.

The set length pump is intended for use in wells 28 feet deep or less or in any place where the vertical suction lift does not exceed 25 feet. A set length pump is very easy to install since it is necessary only to screw sufficient pipe into the lower end of the cylinder to reach to the bottom of a well. However, the distance from the bottom of the cylinder to the surface of the water should not be greater than 25 feet. All pipe joints should be well threaded and screwed up tight. The weight of the pump and pipe should be carried by the well platform or curb, and not upon the suction pipe, as the suction pipe should never rest upon the bottom of the well. When the pump is to be used in a shallow well, it is advisable to soak the cylinder in water for an hour or so. This will cause the plunger leathers to swell and fit more snugly the walls of the cylinder.

By lengthening the pipe and lowering the cylinder into or near the water, this type of pump may be used in wells up to 200 feet deep, depending upon the size of the cylinder and the construction of the pump. For instance, it is not advisable to use Figs. 198, 182, 183, 166 and other light weight pumps shown in this section in wells more than 50 feet deep, while the heavier pumps with longer levers, such as Figs. 211, 290, 219, 442, the "Peerless" Pumps, etc., may be used in wells of much greater depth.

We recommend that a foot valve be placed on the end of the suction pipe if the cylinder cannot be submerged. The foot valve will keep the cylinder and the pipe below the cylinder, full of water at all times, so that the pump will require no priming. However, if the cylinder can be placed in the water, the pump will always be primed and a foot valve will not be necessary. We advise that the cylinder be submerged wherever possible.

On the succeeding pages are described lift and force pumps with cast iron stocks; pipe stocks and adjustable bases; hand, windmill and cog lever tops. The table on opposite page showing the size cylinder which should be used in wells up to 200 feet, will be found useful when figuring a pump installation.

Deming Special Anti-Freezing Lift Pumps

With Set Length Connected Under Spout
For Wells 28 Feet Deep or Less

Fig. 398
Windmill Top

Fig. 198
Open Top

These are the lightest pattern of set length pumps which we manufacture. They are extremely popular and have for many years been favorites with dealers and users. We have made thousands of them.

By lengthening the pipe and lowering the cylinders into the water, this type of pump can be used in wells 50 feet deep or less, with very satisfactory results.

Fig. 198 has pump rod $\frac{3}{8}$ inch diameter.

Fig. 398 has windmill rod 1 inch x $\frac{3}{8}$ inch, threaded $\frac{1}{16}$ inch. Plunger rod is $\frac{3}{8}$ inch. Coupling is $\frac{7}{16}$ inch x $\frac{3}{8}$ inch.

Fig. 398 has the same standard and set length as Fig. 198; the only difference between the two pumps is that Fig. 398 has revolving windmill top instead of hand top.

A drip hole in the set length pipe three feet below base allows the water to flow back into the well and prevents freezing.

Brass Valve Seats are regularly furnished on these pumps.

Deming Special Open Top Hand Lift Pump

With Cog Lever Top and Guarded Gear
For Wells 28 Feet Deep or Less

Fig. 298
Hand Top

This is the same standard as Fig. 198, on opposite page, but is fitted with cog lever top for hand operation. It makes a very light but serviceable cog lever pump which we are able to sell at a low price. Fig. 298 is the simplest form of COG LEVER set length lift pump.

As illustrated, Fig. 298 is adapted for wells 28 feet deep or less; but if the pipe is lengthened and the cylinder lowered into or near the water, it may be used in wells 50 feet deep or less with very satisfactory results. The cylinder rod is $\frac{3}{8}$ of an inch in diameter.

We construct this pump so that the plunger rod is given a direct vertical motion and will not get out of line, which makes it very easy to operate.

The gear guards afford absolute protection from the gears, which are entirely enclosed by the guards.

A drip hole in the set length pipe, three feet below the base, allows the water to flow back into the well and prevents freezing.

Brass Valve Seat is regularly furnished on this pump.

Deming "Mascot" Pipe Standard Lift Pumps

With Adjustable Base and Brace
For Wells 28 Feet Deep or Less

Fig. 182
Open Top

Fig. 482
Open Top

The "Mascot" pump is made with plain and cog lever top as illustrated. That part of the standard below the spout is made of pipe and is fitted with adjustable base which makes it possible to have the pump spout any desired distance above the well platform or sink. The brace is also adjustable and the bearer is of the revolving type.

As illustrated, these pumps are adapted for wells 28 feet deep or less; by lengthening the pipe and lowering the cylinder into or near the water, they are equally serviceable in wells up to 50 feet deep. The stock and set length on each pump is constructed of $1\frac{1}{4}$ -inch pipe. The cylinder rod is $\frac{3}{8}$ of an inch in diameter.

The cog lever top on Fig. 482 insures frictionless operation. The plunger rod receives a direct vertical motion which makes the operation extremely easy. The gears are entirely enclosed by gear guards.

A drip hole in the set length pipes of each of these pumps, three feet below the base, allows the water to flow back into the well and prevents freezing. Figs. 182 and 482 have six-inch stroke.

Brass Valve Seats are regularly furnished on these pumps.

Deming Special Well Hand Lift Pumps

With Adjustable Base
For Wells 28 Feet Deep or Less

Fig. 166
Open Top

FIG. 166 "NEW MODEL" has a large spout casting which provides a receptacle of sufficient size to prevent the water from spurting out at the top. The curved siphon spout insures a uniform discharge. A heavy split base is furnished, so that a brace is not needed. The bearer can be set at any angle to the spout, and the base being adjustable, permits the standard to be any desired height. The cylinder rod is $\frac{7}{8}$ inch diameter.

FIG. 183 also has an adjustable base and brace, permitting the standard to be any desired height. The base is cup-shaped and will fit over the top of any size casing up to six inches diameter. Pump rod is $\frac{1}{2}$ -inch cold-rolled steel, welded to $\frac{3}{8}$ -inch plunger rod.

The standards and set lengths of these pumps are constructed of $1\frac{1}{4}$ -inch pipe. As illustrated, Figs. 166 and 183 are adapted for use in wells 28 feet deep or less, but if the pipe is lengthened and the cylinder lowered into or near the water, they may be used in wells 50 feet deep or less. A drip hole in the set length pipe three feet below the base allows the water to flow back into the well and prevents freezing.

Brass Valve Seats are regularly furnished on these pumps.

Deming Improved Non-Freezing Hand Lift Pump

With Open Top
For Wells 28 Feet Deep or Less

Fig. 211

One of our best known and most popular lift pumps. A well-balanced, medium-weight pump. The base is cast solid on the stock and set length pipe is connected under the spout, insuring delivery of the water after a few strokes of the handle. Suitable for open or drilled wells.

Pump rod is $\frac{1}{8}$ -inch steel and is fastened to lever with a rod eye and set screw. This rod eye is furnished to enable repairs to be made by any person equipped to thread the rod.

The lever may be set at any angle to the spout. Bearer is secured to the stock by three set screws.

As illustrated, Fig. 211 may be used in wells 28 feet deep or less.

However, by lengthening the pipe and lowering the cylinder into or near the water, it may be used in wells 50 to 75 feet deep, depending upon the size of the cylinder—see table on page 30.

A drip hole in the set length pipe three feet below the base allows the water to flow back and prevents freezing.

Brass Valve Seat is regularly furnished on this pump.

Deming Non-Freezing Windmill Lift Pump

Fig. 421

With Tight Top
For Wells 28 Feet Deep or Less

This pump is similar to Fig. 211 shown on the opposite page except that it is fitted with windmill top. The addition of this windmill top gives a vertical motion to the piston rod, preventing an uneven action of the plunger in the cylinder and adapts the pump for operation by windmill.

The flat rod of Fig. 421 fits the top snugly and prevents dirt, stones, or other foreign substances from getting into the pump.

As illustrated, Fig. 421 may be used in wells 28 feet deep or less. However, by lengthening the pipe and lowering the cylinder into or near the water, they may be used in wells 50 to 75 feet deep, depending upon the size of the cylinder—see table on page 30. Fig. 421 has windmill rod, 1 x $\frac{3}{8}$ inch, threaded $\frac{1}{16}$ inch. Plunger rod is $\frac{1}{16}$ inch. Coupling is $\frac{1}{16}$ x $\frac{3}{8}$ inch.

A drip hole in the set length pipe just above the cylinder prevents freezing. Length of stroke is six inches.

Brass Valve Seats are regularly furnished on these pumps.

Deming Pipe Standard Hand Force Pump

With Adjustable Base and Brace
Will Lift and Force 50 Feet

Fig. 185
Force Pump

FIG. 185 SINGLE-ACTING FORCE PUMP is a very good light weight pump, popular with dealer and user alike. The standard and set length consists of 1¼-inch pipe. Base and brace may be quickly adjusted for varying distances between well platform and spout. Pump rod is ½-inch cold-rolled steel, welded to ⅜-inch plunger rod.

FIG. 184 DOUBLE-ACTING FORCE PUMP is one of our latest designs of force pumps, the construction permitting adjustment of the spout to any desired height. It can be used in either open or drilled wells. The cup-shaped base will fit over the top of any size casing up to six inches in diameter.

Fig. 184 has a differential plunger which causes a continuous flow of water at the spout. The cylinders furnished with Fig. 184 are sufficiently long to give full six-inch stroke, either in iron, brass-lined or brass tube, capped inside or outside, as listed. Fig. 184 has ½-inch plunger rod fitted with ½ x ⅜-inch coupling.

Both pumps are regularly supplied with hose nut and tube. A drip hole in the set length pipe just above the cylinder prevents freezing. Length of stroke is six inches.

Brass Valve Seats are regularly furnished on these pumps.

Deming Non-Freezing Hand Force Pumps

With Revolving Top

Fig. 219

Will Lift and Force 35 to 75 Feet

Fig. 223

The pumps illustrated on this page are similar in most respects. They differ principally in the construction of the air chamber, which in Fig. 219 is in the standard and cast integral with it. Fig. 223 has a separate air chamber, bolted to the standard, this air chamber being fitted with upward discharge for forcing water into elevated tanks. They are furnished with hose tubes, as shown. As listed, they are adapted to wells 28 feet deep, but when the cylinder is lowered into or near the water, they may be used in wells up to 100 feet deep if a cylinder of smaller diameter is used than listed below—see table on page 30. The rod on these pumps is $\frac{5}{8}$ -inch cold-rolled steel, welded to $\frac{1}{8}$ -inch plunger rod.

A drip hole in the set length pipe, three feet below base, allows the water to flow back into the well and prevents freezing.

Repairs for our pumps will always fit.

If Fig. 223 is wanted with plain spout instead of cock spout, deduct \$2.50 from list.

Fig. 219 has back outlet tapped for $1\frac{1}{4}$ -inch pipe.

Fig. 219 furnished with cock spout at \$2.50 extra, list.

Brass Valve Seats are regularly furnished on these pumps.

Deming "Premium" Hand Force Pumps

Fig. 291

With Adjustable Base

Will Lift and Force 35 to 75 Feet

For yard use we consider these pumps to have no equal. They are very easy to operate and are so substantially built as to be practically exempt from breakage.

Figs. 290 and 291 have adjustable bearers, braces and bases, so that the standards may be lengthened or shortened as desired and the levers swung around to any angle with the spouts. The heavy metal balls on the extra long wooden levers makes pumping easy.

In Fig. 290 the stock is made of $1\frac{1}{2}$ -inch pipe while the set length is $1\frac{1}{4}$ -inch pipe, with the exception of No. 6 size, which has $1\frac{1}{2}$ -inch set length pipe.

Fig. 291 differs from Fig. 290 in the following respects. It is fitted with a cock spout instead of plain spout; has a back outlet tapped for $1\frac{1}{4}$ -inch pipe; the standard and set length are respectively constructed of 2-inch and $1\frac{1}{4}$ -inch pipe except the No. 6 size which has $1\frac{1}{2}$ -inch set length. The back outlet makes it possible to force water into elevated tanks. The base is cup-shaped and will fit over the top of any size casing up to six inches diameter. If plain spout is wanted, deduct \$2.50 from list price.

Plunger rod through stuffing box is $\frac{5}{8}$ -inch cold-rolled steel, welded to $\frac{3}{8}$ -inch steel rod, coupled to $\frac{3}{8}$ -inch stub rod on cylinder. On No. 6 size, lower end of plunger rod and stub rod on cylinder is $\frac{1}{4}$ inch.

Both pumps have hose nut and tube.

As illustrated, Figs. 290 and 291 are adapted for use in wells 28 feet deep or less, but by lengthening the pipe and lowering the cylinder into or near the water, they may be used in wells up to 200 feet deep, provided a cylinder of smaller diameter is used than listed below—see table on page 30. A drip hole in the set length pipe three feet below the base allows the water to flow back into the well and prevents freezing.

Brass Valve Seats are regularly furnished on these pumps.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Non-Freezing Windmill Force Pump

With Cock Spout and Back Outlet
Will Lift and Force 35 to 75 Feet

Fig. 442

This popular set length pump is adapted for hand or windmill use. It has the same standard as Figs. 440 and 444. The windmill top gives a direct vertical motion to the plunger, thus wearing the cylinder smoothly and evenly. Fig. 442 has revolving tight top and brass stuffing box gland. Accurate and permanent alignment of the piston rod is secured by casting the stuffing box and rod guide in one piece.

The lever can be disconnected when the pump is to be operated by windmill. Spout is flanged and bolted to the standard. Hose tube and nut are regularly furnished. Bearer is clamped to the stock by three hook bolts. Fig. 442 has windmill rod 1 x $\frac{3}{8}$ inch, threaded $\frac{1}{2}$ inch. Plunger rod through stuffing box is $\frac{3}{4}$ -inch cold-rolled steel, coupled to $\frac{1}{8}$ -inch plunger rod. Back outlet is regularly tapped for 1 $\frac{1}{4}$ -inch pipe.

Fig. 442 may be installed in wells up to 200 feet if a smaller diameter cylinder is used than listed below — see table on page 30.

A drip hole in the set length pipe, three feet below the base, allows the water to flow back into the well and prevents freezing.

Deduct \$2.50 from list price if plain spout is desired instead of cock spout.

Brass Valve Seat is regularly furnished on this pump.

Deming "Peerless" Double-Acting Force Pumps

A Brief Description of this Famous Complete Line of Pumps

Illustration (in Section) of Fig. 283 "Peerless" Force Pump.

"Peerless" Pumps are made for either shallow, deep or drilled wells, and with or without three-way attachment — with or without windmill top. Any of them may be had with cog lever top. We make the cog lever pumps WITH WINDMILL OR HAND TOP and we can furnish them either way at the same price, since the extra length of windmill rod is the only difference between the hand and windmill cog lever pumps.

EASY TO OPERATE: "Peerless" Pumps are so often found in country school yards and railway stations, because they are so easy to operate. Directly under the lever of every "Peerless" Pump is an air chamber pipe which compresses the supply of air and acts as an elastic cushion, keeping the same amount of water in the discharge pipe so that the water flows from the spout in a steady stream without spurting or splashing.

THE DIFFERENTIAL CYLINDER EQUALIZES THE LOAD: On the up stroke of the plunger the water from the lower cylinder is lifted through the cylinder pipe and pump passages. One-half is forced through the spout and the other half follows the differential piston into the differential cylinder. On the downward stroke, the differential piston forces down and

out through the spout the water that followed it on the up stroke. Thus the pump discharges half the water on the up stroke and half on the down stroke.

Because of the differential cylinder, no stuffing boxes are used. There is nothing, therefore, to hinder the passage of the plunger rod. When garden hose is attached to the spout, there will be no leakage at top of air chamber.

When windmill power is to be applied to the "Peerless" windmill pumps, it is necessary to remove just one pin, and the handle drops down. When this operation is reversed, the pin will always FIT.

The stock is a single casting. The pipes are held rigidly in place by an ingenious clamp which prevents them from swinging. THE DISCHARGE AND AIR CHAMBER PIPES ARE GALVANIZED. On the succeeding six pages the "Peerless" pumps are illustrated and further described.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Double-Acting "Peerless" Force Pumps

For Shallow Wells

Will Lift and Force 35 to 75 Feet

Fig. 280
Hand Top

Dealers will find that these pumps are a great convenience because the Shallow Well Pumps, Figs. 280 and 450, can readily be made into the Deep Well Pumps, Figs. 281 and 451, see page 44. This is accomplished by simply detaching the lower cylinder and connecting to it the attachment "B" and to the lower pump casting the attachment "A." This feature of adjustability is an advantage that gives the dealer four styles of pumps by carrying two styles; together with the attachments. When fitted for deep wells these pumps may be used in wells up to 200 feet deep, if a smaller diameter cylinder is used than is listed below—see table on page 30.

Fig. 280 has $\frac{1}{2}$ -inch plunger rod fitted with $\frac{1}{2} \times \frac{3}{8}$ -inch coupling.

Fig. 450 has windmill rod $1 \times \frac{3}{8}$ inch, welded to $\frac{1}{2}$ -inch steel rod, and connected to plunger rod with union coupling. Plunger stub rod is threaded $\frac{3}{8}$ inch.

Nos. 2 and 4 "Peerless" Pumps, Figs. 280 and 450, are the most popular size, as they will go in $5\frac{5}{8}$ -inch well casing.

Attachments "A" and "B" to make "Peerless" shallow well pumps into deep well pumps, \$1.00 per pair.

A drip hole in the discharge pipe, three feet below base, allows the water to flow back into the well and prevents freezing.

Brass Valve Seats are regularly furnished on these pumps.

Deming "Peerless" Double-Acting Force Pumps

For Deep Wells
Will Lift and Force 35 to 75 Feet

Fig. 451
Windmill Top

Fig. 281
Hand Top

Instead of having the cylinder attached to the set length as is the case in Figs. 280 and 450, described on the preceding page, Figs. 281 and 451 are furnished with the deep well attachments "A" and "B," and a separate brass-lined cylinder (Fig. 308) which can be dropped down into the well, thereby adapting the pump to wells 200 feet deep or less, if a smaller diameter cylinder is used than is listed below—see table on page 30.

Fig. 281 has $\frac{1}{2}$ -inch plunger rod fitted with $\frac{1}{2} \times \frac{3}{8}$ -inch coupling.

Fig. 451 has windmill rod $1 \times \frac{3}{8}$ -inch, welded to $\frac{1}{2}$ -inch steel rod and connected to plunger rod with union coupling. Plunger stub rod is threaded $\frac{3}{8}$ inch.

If the lower cylinder is placed in the water, the pump will not require priming.

A drip hole in the discharge pipe, three feet below the base, allows the water to flow back into the well and prevents freezing.

Brass Valve Seats regularly furnished on these pumps.

Deming "Peerless" Double-Acting Force Pumps

For Drilled Wells

Will Lift and Force 50 to 75 Feet

Fig. 282
Hand Top

Since most drilled wells are of small diameter, we make this "Peerless" type with air chamber and suction pipe close together.

The two cylinders are not connected by pipe, but are left separate so that the lower cylinder may be dropped down to any desired depth. Better results are usually obtained if the lower cylinder is placed in the water. These pumps may be used in wells up to 200 feet deep if a smaller diameter cylinder is used than is listed below—see table on page 30.

Fig. 282 has $\frac{1}{4}$ -inch galvanized steel pump rod and fitted with $\frac{1}{4}$ x $\frac{3}{8}$ -inch coupling.

Fig. 452 has windmill rod 1 x $\frac{3}{8}$ inch, threaded $\frac{1}{4}$ inch, and coupled to $\frac{1}{4}$ -inch plunger rod with compression coupling. Lower end of rod is furnished with $\frac{1}{4}$ x $\frac{3}{8}$ -inch coupling for cylinder rod.

The lower cylinder furnished with this type of "Peerless" pump is our flush capped cylinder, Fig. 322.

A drip hole in the discharge pipe, three feet below the base, allows the water to flow back into the well and prevents freezing.

Brass Valve Seats are regularly furnished on these pumps.

Deming "Peerless" Double-Acting Force Pumps

With Three-Way Valve for Underground Discharge
Will Lift and Force 50 to 75 Feet

**Fig. 283
Hand Top**

With this style of the "Peerless" pumps, the water may be discharged through the spout or through the underground discharge pipe by simply turning a hand-wheel at the top of the spout which operates the distributing valve in the discharge pipe.

Well casing must come only to the UPPER cylinder attachment, 4 feet, 3 inches below the base of the pump, and a pit of that depth should be dug to accommodate the distributing valve. Our new distributing valve is the acme of perfection. With it the water may be discharged through the underground discharge pipe, into a tank at house or barn, a considerable distance from the well.

The lower cylinder furnished with this type of "Peerless" pump is our flush capped cylinder, Fig. 322. These pumps may be used in wells up to 200 feet deep, if a smaller diameter cylinder is used than is listed below—see table on page 30.

Fig. 283 has $\frac{1}{2}$ -inch plunger rod fitted with $\frac{1}{2} \times \frac{3}{8}$ -inch coupling.

Fig. 453 has windmill rod $1 \times \frac{3}{8}$ -inch, welded to $\frac{1}{2}$ -inch steel rod and connected to plunger rod with union coupling. Plunger stub rod is threaded $\frac{3}{8}$ inch.

A drip hole in the discharge pipe, 3 feet below the base, allows the water to flow back into the well and prevents freezing.

Brass Valve Seals are regularly furnished on these pumps.

Deming "Peerless" Cog Lever Force Pumps

Fig. 450½, for Shallow Wells

**For Shallow and Deep Wells
Will Lift and Force 50 to 75 Feet**

Fig. 451½ For Deep Wells

These two pumps are fitted with the Deming Cog Lever Top, but otherwise they are the same as Figs. 450 and 451, pages 43 and 44, respectively.

No. 2 can be used by hand in wells up to 75 feet deep; No. 4 in wells up to 50 feet deep; No. 6 in wells up to 35 feet deep or less, than the depth mentioned. Our Fig. 308 cylinder is furnished with these pumps. For deeper wells a smaller cylinder should be used than is listed below—see table on page 30.

Figs. 450½ and 451½ have windmill rod 1 x ¾ inch, threaded ¼ inch and coupled to ½-inch plunger rod with compression coupling. Lower end of rod is furnished with ¼ x ¾-inch coupling for cylinder rod.

The "Peerless" pumps with cog lever can be used either by hand or windmill. The gear guard **ABSOLUTELY PREVENTS** possibility of CHILDREN'S FINGERS becoming caught in the cogs.

When used as a hand pump, a pin is inserted at the opening "C." When used as a windmill pump the pin is taken out, which allows the handle or lever "E" to drop down, and in addition a windmill slide rod is attached.

Brass Valve Seats are regularly furnished on these pumps.

Key to Engraving

- A—Wood rod of windmill.
 - B—Hercules windmill connection.
 - C—Opening for steel pump pin used always with hand pumps.
 - D—Combination coupling for connecting flat and round rod.
 - E—Lever, which hangs down when pin is removed from "C."
 - F—Gear guard, partly broken away to show cogs "G" on lever and rack.
 - G—Cog mechanism, a part of lever "E."
 - H—Actuating rack for hand use.
- When used by hand the pin **MUST** be inserted at "C."
- J—Bolt for supporting air chamber pipe.

Deming "Peerless" Cog Lever Windmill Force Pumps

Fig. 452½
For Drilled Wells

**For Drilled Wells; and with Three-Way
Distributing Valve**

Fig. 453½
**With Three-Way
Discharge Valve**

Will Lift and Force 50 to 75 Feet

Figs. 452½ and 453½ are the same as pumps illustrated on pages 45 and 46, respectively, except that these pumps are fitted with cog lever tops instead of the plain windmill top.

These cog lever "Peerless" pumps are made WITH WINDMILL OR HAND TOP and we can furnish them either way at the same price, since the extra length of windmill rod is the only difference between the hand and windmill cog lever pumps. They may be used in wells up to 200 feet deep, if smaller diameter cylinders are used than listed below—see table on page 30.

All "Peerless" pumps are furnished with hose tubes so that garden hose can be used.

The lower cylinder furnished with this type of "Peerless" pump is our flush capped brass body cylinder, Fig. 322.]

Figs. 452½ and 453½ have windmill rod 1 x 3⁄8 inch, threaded 1⁄8 inch and coupled to ½-inch plunger rod with compression coupling. Lower end of rod is furnished with 1⁄8 x 3⁄8-inch coupling for cylinder rod.

A drip hole in the set length pipe, three feet below the base, allows the water to flow back into the well and prevents freezing.

Brass Valve Seats are regularly furnished with these pumps.

Typical Deming Force Pump Standard (in Section)

For Operation By Hand or Windmill

This illustration will serve to identify the parts entering into the construction of a pump standard. It portrays our Fig. 444 windmill force pump standard, which is a representative type of the classification to which this particular section of our Catalogue is devoted.

The term "Standard," as applied to pumps, indicates a pump stock with bearer, lever and rod connection fitted for pipe and adapted for use with any ordinary independent cylinder when pipe and rod are added. "Standards" are classified as follows: Hand lift pump standard; Windmill lift pump standard; Hand force pump standard; Windmill force pump standard; Deep well force pump standard, also hand and windmill standards with underground discharge, all of which are described on the following pages of this section.

The dealer can fit a pump for a well of any depth by securing the proper standard and cylinder and supplying the pipe and rod from his stock. Many dealers do this in preference to buying the complete set length pump.

When standards are required for wells 75 feet deep or more, well pipe should be carried by independent supports in the well, so that the weight of the pipe will not be carried entirely by the thread in the standard. The cylinders should in no case be placed a greater distance than twenty feet above the water to secure good suction, and wherever possible they should be submerged. The size of cylinder to be used with each standard is determined by the depth of the well. (See table on page 30.)

Deming standards with six inch stroke are fitted regularly for $1\frac{1}{4}$ inch pipe; with ten inch and adjustable stroke, for two inch pipe. However, we will tap them for other sizes of pipe, when so ordered, and will also thread the stub of the rods of both the standards and cylinders for such sizes of couplings as may be specified.

Deming standards are the result of years of experience. They are well proportioned and practical, and are as near perfection as it is possible to make them.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Improved Well Lift Pump Standard

With Pipe Connection Under Spout
For Wells 70 Feet Deep or Less

Fig. 224—Open Top

This pump standard is suited for use in wells up to 70 feet deep. It has solid base and is threaded for pipe under the spout.

Attached to the lever of Fig. 224 is a rod eye connection for $\frac{1}{4}$ -inch well rod. A set screw on this connection holds the rod in place. When the pump is installed, the complete length of $\frac{1}{4}$ -inch or $\frac{3}{8}$ -inch rod may be used from cylinder to top of pump, without coupling. *For this reason we do not furnish Fig. 224 with stub rod.*

Fig. 224 is tapped in the standard for 2-inch pipe. A combination bushing, however, is regularly furnished for $1\frac{1}{4}$ -inch or $1\frac{1}{2}$ -inch pipe, thus adapting it for varying conditions.

Cylinders or working barrels for use with this pump will be found elsewhere.

Sizes and Prices

No.	Fitted for Pipe	Length of Stroke Inches	Height Inches	Weight Pounds	Cipher	Price
4	$1\frac{1}{4}$	6	45	50	BELCH	\$5.50

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Deep Well Lift Pump Standard With Bolted Pipe Flange

For Wells 150 Feet Deep or Less

Fig. 230

Fig. 230 is an extra heavy lift pump standard, which will give good service in wells 150 feet deep, provided a two-inch cylinder is used. It is, of course, more desirable to install the pump in wells of lesser depth.

Fig. 230 is made in two sections, with pipe flange bolted between so that the upper section can be removed while connection is being made to the well pipe. After the operation is completed, the upper section can be replaced.

With such a heavy pump as Fig. 230, the flange construction will be found very convenient, because, when making the connection to well pipe, there is only the lower section to be handled. The lever is long and weighted.

Pump rod is $\frac{3}{8}$ -inch piston rod steel, threaded $\frac{1}{4}$ -inch and fitted with $\frac{1}{4}$ x $\frac{3}{8}$ -inch reducing coupling for connecting to $\frac{3}{8}$ -inch well rod.

Fitted for $1\frac{1}{4}$, $1\frac{1}{2}$, or $2\frac{1}{2}$ -inch pipe when so ordered. Extra pipe flanges, 50 cents extra list.

Sizes and Prices

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Deep Well Force Pump Standards With Upward Discharge

Fig. 231 Will Lift and Force 35 to 150 Feet Fig. 1231

Provided a two-inch cylinder is used, Figs. 231 and 1231 will lift and force 150 feet, but of course it is more desirable to install them where the duty is not quite so heavy, and then use 2½ or 3-inch cylinders. These are very heavy and substantial force pump standards, and are very often used as school pumps, town pumps, etc. They are especially well adapted to coal mining sections, or wherever unusually hard service is to be expected.

These pumps are made in two sections with pipe flange bolted between, so that the upper section can be removed while connection is being made to well pipe. After the operation is completed, the upper section can be replaced.

This makes it necessary to handle only the lower section, during the installation. In the case of such heavy pumps, dealers and well drillers will much appreciate this feature.

Fig. 1231 is furnished regularly with cock spout, and with nut on upward discharge, tapped for pipe. Fig. 231 has plain spout fitted with hose nut and tube. Air chamber of Fig. 231 is fitted with cap nut on upward discharge.

Pump rod is ¾-inch piston rod steel, threaded ⅞-inch and fitted with ⅞ x ¾-inch reducing coupling for connecting to ¾-inch well rod.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Improved Well Force Pump Standards With Air Chamber in the Stock Will Lift and Force 35 to 100 Feet

Fig. 229

Fig. 1229

Well force pump standards with solid base, Figs. 229 and 1229, when used in connection with cylinders of the proper sizes will lift and force 35 to 100 feet. To prevent freezing, the pipe should be provided with a drip hole three feet below the base, which allows the water to flow back after pump has been used.

The air chamber is formed by enlarging the stock above the spout. By loosening one set screw, the lever may be set at any angle to the spout. The spout is flanged and bolted to the standard, and is furnished with nut and $\frac{3}{4}$ -inch hose tube.

Pump rod is $\frac{5}{8}$ -inch cold rolled steel, threaded $\frac{1}{4}$ -inch and fitted with reducing coupling for $\frac{3}{8}$ -inch well rod.

Fig. 1229 is regularly furnished with cock spout. Cylinders or working barrels for use with these standards are listed elsewhere.

*Fitted for $1\frac{1}{2}$ or 2-inch pipe when so ordered.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Improved Well Force Pump Standards With Air Chamber Bolted on the Standard Will Lift and Force 35 to 100 Feet

Fig. 239

Fig. 1239

Well force pump standards with solid base, Figs. 239 and 1239 when used in connection with cylinders of the proper sizes, will lift and force 35 to 100 feet. To prevent freezing, the pipe should be provided with a drip hole, three feet below the base, which allows the water to flow back into the well after pumping.

The air chamber is separate and bolted to standard. The upward discharge of Fig. 239 is furnished with a cap nut, spout, hose nut and tube. Air chamber of Fig. 1239 is fitted with nut tapped for pipe on upward discharge.

By loosening one set-screw, the lever may be set at any angle with the spout. Fig. 1239 is regularly supplied with cock spout. Otherwise it is same as Fig. 239.

Pump rod is $\frac{5}{8}$ -inch piston rod steel, threaded $\frac{1}{4}$ -inch and fitted with reducing coupling for $\frac{3}{8}$ -inch well rod.

Cylinders or working barrels for use with these standards are listed elsewhere.

Sizes and Prices

Fig.	Stroke Inches	Fitted for * Pipe Inches	Height Inches	Upward Dis- charge Fitted for Pipe Inches	Weight Pounds	Cipher	Price

1239	6	1 $\frac{1}{4}$	49	1 $\frac{1}{4}$	85	BURSAR	13.50

*When so ordered, can be fitted for 1 $\frac{1}{2}$ or 2-inch pipe.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Windmill Lift Pump Standards For Wells 100 Feet Deep or Less

Fig. 403

Fig. 394

FIG. 403 is one of our most popular windmill lift pump standards. It is strong and substantial, and symmetrical in design. The pipe screws into the stock under the spout. Fig. 403 is regularly tapped in the standard for 2-inch pipe. To adapt it for 1½-inch or 1¼-inch pipe we will furnish a combination bushing when specified.

FIG. 394 is a swell top windmill lift pump standard adapted for either tubular or drilled wells. The enlarged top forms a water chamber which prevents the water from escaping at the top. Furnished regularly with solid windmill rod. Base is cast solid on the stock.

Both of the standards have adjustable bearers. Pump rod is threaded 1½-inch and is supplied with a coupling for reducing to ¾-inch. Cylinders or working barrels for use with these standards will be found elsewhere.

Deming Windmill Force Pump Standards

With Adjustable Stroke and Solid Rod

Fig. 484

For Wells 80 Feet Deep or Less

Fig. 1444

Fig. 484 is a very useful Force Pump Standard, with windmill top and swivel spout. This pump can be used with any of our independent cylinders shown elsewhere. In certain cases there are advantages in using a pump of this kind, since the position of the spout and lever can be changed at will after the pump is set in the well. The fulcrum top and the spout can be placed in any desired position with relation to each other. A separate flange between the base and the top permits the well pipe to be easily attached. Windmill rod is 1 x $\frac{3}{8}$ inch, welded to 1 $\frac{1}{4}$ -inch cold-rolled steel, threaded $\frac{1}{4}$ -inch, and supplied with coupling for reducing to $\frac{3}{8}$ -inch. This pump, as shown, has solid rod, which can be removed without disturbing the fulcrum top or stuffing-box. This is a great advantage when installing the pump. If plain spout is wanted, instead of cock spout, deduct \$2.50 from list.

Fig. 1444 is similar to our Figs. 440 and 444, illustrated elsewhere, except that it is fitted with a solid rod, the same as Fig. 484.

Sizes and Prices

*Fitted for 1 $\frac{1}{4}$ or 2-inch pipe when especially so ordered.

†When especially ordered, adjustable stroke pumps will be fitted for 12-inch windmill stroke.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Windmill Lift Pump Standard With Long Fulcrum For Wells 35 to 100 Feet Deep

Fig. 494

Our improved Windmill Lift Pump Standard, with extra long fulcrum, will be greatly appreciated by pump dealers and users. The long fulcrum throws all the strain of the lever when pumping, on the base of the pump instead of the pump top. By this arrangement the pump top and rod guide will always remain rigid and in place.

The illustration shows Fig. 494 with adjustable stroke. It is also made with six-inch stroke, as listed below.

The pump rod is threaded $\frac{1}{8}$ -inch, and is fitted with a $\frac{1}{8} \times \frac{3}{8}$ -inch coupling, so that $\frac{1}{8}$ or $\frac{3}{8}$ -inch rod may be used. Pumps that are tapped for two-inch pipe will, when specified, be fitted with one-inch wood rod fork.

Cylinders or working barrels for use with this standard are illustrated and listed elsewhere.

Sizes and Prices

491	6, 8 and 10	2	70	DEJECTION	10.00

*Fitted for 1, 1 $\frac{1}{4}$, 1 $\frac{1}{2}$ or 2-inch pipe, but always as listed, unless otherwise ordered.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Windmill Force Pump Standards

With Long Fulcrum and Back Outlet
Will Lift and Force 35 to 200 Feet

Fig. 496

The long fulcrum or bearer throws all of the lever strain on the base when pumping, instead of putting it on the pump top.

Accurate and permanent alignment of the piston rod is secured by casting the stuffing-box and rod guide in one piece. The levers can be disconnected when the pump is to be operated by windmill. The spout is flanged and bolted to the standard. Hose tube and nut are regularly furnished.

Back outlet is tapped regularly for $1\frac{1}{4}$ -inch pipe, for discharging into elevated tank. Pump rod is made of $\frac{3}{4}$ -inch piston rod steel. It is threaded $\frac{1}{8}$ -inch and is furnished with a $\frac{1}{8} \times \frac{3}{8}$ -inch coupling so that $\frac{1}{8}$ or $\frac{3}{8}$ -inch well rod may be used.

Where there is no liability to danger from freezing, we recommend the use of foot valves with these standards. Figs. 496 and 498 are made to exact gauges so that repairs will always fit.

Fig. 498 is regularly furnished with cock spout. Otherwise it is exactly like Fig. 496.

Cylinders or working barrels for use with these standards are illustrated and listed elsewhere.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Windmill Force Pump Standards

With Back Outlet

Will Lift and Force 35 to 200 Feet

Fig. 440

These popular Standards are adapted for hand or windmill use. They have revolving tight top. The piston rod is always in line because the stuffing-box and rod guide are made in one casting. Stuffing-box gland is brass. The lever can be disconnected when the pumps are to be operated by windmill. The spout is flanged and bolted to the Standard. Hose tube and nut are regularly furnished. The bearer is secured with strong hook bolts.

The back outlet on each pump is tapped for 1¼-inch pipe.

The pump rod is made of ¾-inch piston rod steel; is threaded 1/8 inch and is furnished with a 7/8 x 3/8-inch coupling, so that 1/8 or 3/8-inch well rod may be used.

Fig. 444

Where there is no liability to danger from freezing, we recommend the use of foot valves and strainers with these standards. Figs. 440 and 444 are made to exact gauges, so that repairs will always fit.

Cylinders or working barrels for use with these standards are illustrated and listed elsewhere.

Deming Windmill Force Pump Standard

With Cog Lever Top

Will Lift and Force 35 to 200 Feet

Fig. 444½

This is a standard for hand or windmill use, equipped with cog lever top instead of plain windmill top. The gear action is well guarded to prevent accidents. The rack can be disconnected when the pump is to be operated by windmill.

The bearer is adjustable and is secured to the stock by three hook bolts. The piston rod is always in line because the stuffing-box and rod guide are made in one casting. Stuffing-box gland is brass. The spout is flanged and bolted to the standard. Hose tube and nut are regularly included. Back outlet is tapped for 1¼-inch pipe.

The pump rod is made of ¾-inch piston rod steel; is threaded 1⅞-inch and is furnished with a 1⅞ x ⅜-inch coupling, so that 1⅞ or ⅜-inch well rod may be used.

Where there is no liability of freezing, we recommend the use of a foot valve and strainer with this standard.

Deduct \$2.50 from list price if plain spout is desired instead of cock spout.

Cylinders or working barrels for use with this standard are illustrated and listed elsewhere.

Deming Windmill Force Pump Standard With Renewable Guide Bushing and Patented Windmill Top Will Lift and Force 35 to 200 Feet

Fig. 445

Complete
View of
Fig. 445

Detail View
of Patent
Windmill Top

This is a good heavy windmill standard suitable for operation by pump jack or windmill. The windmill top is of new design and is heavily reinforced at the points where in other pumps of this type breakage is most liable.

The detail view (illustration to the left) shows our new patented windmill top and air chamber tube. The patented feature consists of a loose ring which keeps the three bolts in place and prevents them from falling to the ground or into the well, should it be necessary to remove the top.

The bushing on the windmill slide rod can be renewed when worn. In many pumps it is necessary to buy an entire new top when the guide wears out.

Fig. 445 is tapped in the standard for 2-inch pipe. A combination bushing, however, is regularly furnished for $1\frac{1}{4}$ and $1\frac{1}{2}$ -inch pipe, thus adapting it for varying conditions. The pump rod is made of $\frac{3}{4}$ -inch piston rod steel. It is threaded $\frac{1}{8}$ -inch and is furnished with a $\frac{1}{8} \times \frac{3}{8}$ -inch coupling so that $\frac{1}{8}$ -inch or $\frac{3}{8}$ -inch rod may be used.

Where there is no liability to danger from freezing, we recommend the use of foot valve and strainer with this standard.

The spout is provided with a hose nut and tube. Deduct \$2.50 from list price if cock is not desired.

Cylinders or working barrels for use with this standard are shown and listed elsewhere.

Deming Windmill Force Pump Standard With Flanged Base and Patented Bearer Will Lift and Force 35 to 200 Feet

Fig. 441

Complete View of Fig. 441

Detail View of Patent
Windmill Top

This is a very strong, durable and convenient standard. The bearer is clamped to the stock by three hook bolts. Should it become necessary for any reason to remove the bearer, the bolts will be kept in place by a loose ring, which prevents them from dropping to the ground or in the well. The detail cut explains this construction. This style of bearer is fully covered by our patents.

A separate flange between the base and the stock permits the well pipe to be easily attached. This makes it possible to remove the standard while connection is being made to the well pipe, which is a very much easier method of installing, than if the entire heavy pump had to be handled during the setting.

Fig. 441 is regularly furnished with $\frac{3}{4}$ -inch brass cased plunger rod, threaded at the bottom $\frac{1}{8}$ -inch and furnished with a $\frac{1}{8} \times \frac{3}{8}$ -inch coupling so that either $\frac{1}{8}$ or $\frac{3}{8}$ -inch steel rod may be used.

Fig. 441 has a brass packing gland. When tapped for two-inch pipe and larger, our artesian well cylinders, Figs. 311 and 324, may be used to advantage in connection with this pump. Other cylinders or working barrels for use with this standard are listed elsewhere.

The bushing on the windmill slide rod can be renewed when worn. In many pumps it is necessary to buy an entire new top when the guide wears out. The heavy metal ball will be found an aid to pumping — especially if the well is very deep. Cock spout is fitted with hose nut and tube.

Fig. 441 is made with adjustable stroke only. Deduct \$2.50 if plain spout is wanted instead of cock spout.

Where there is no danger from freezing, we recommend the use of foot valve and strainer with this standard.

Sizes and Prices

†When especially ordered, adjustable stroke pumps will be fitted for 12-inch windmill stroke.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Windmill Force Pump Standard

With Air Chamber, Cock Spout and Flanged Base
Will Lift and Force 35 to 200 Feet

Fig. 407

Fig. 407 has a flange for pipe, located near the base. This makes it possible to remove a large part of the pump while connection is being made to the well pipe, which is a very much easier method of installing the pump, than if the entire heavy pump had to be handled during the setting. The bolts in the air chamber are so spaced that the spout can be turned 90 degrees in either direction.

Fig. 407 has an upward and back outlet or discharge. This pump can be attached to pipe up to three inches, which especially adapts it for use with artesian well cylinders. Air chamber is fitted with a nut tapped for pipe on upward discharge.

Where there is no danger from freezing, we would recommend the use of foot valve and strainer with this standard.

Pump rod is made of $\frac{3}{4}$ -inch piston rod steel, threaded $\frac{1}{8}$ -inch at the bottom and furnished with a reducing coupling for $\frac{3}{8}$ -inch well rod.

Fitted for $1\frac{1}{4}$, $1\frac{1}{2}$, 2, $2\frac{1}{2}$ or 3-inch pipe, but always as listed, unless otherwise ordered. Extra flanges, 50 cents each.

Cylinders or working barrels for use with this standard are shown and listed elsewhere.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Special Windmill Force Pump Standard

Will Lift and Force 35 to 200 Feet
With Underground Discharge

Fig. 408

Fig. 408 has been heavily reinforced in the places which are most liable to breakage in a pump of this kind, so that it is well adapted for operation by pump jack. The stock is of uniform diameter — three inches — between the two rings so that all makes of jacks can be used.

Should it be necessary to remove the bearer, the three hook bolts can be loosened and the top taken off, but the bolts are kept from dropping to the ground or into the well by the loose ring which holds them securely in place. This feature is patented.

The air chamber of Fig. 408 is two inches in diameter. A $1\frac{1}{4}$ -inch differential cylinder is furnished instead of a stuffing-box. The pump rod is $\frac{3}{4}$ -inch and is one complete rod, unbroken by couplings, except where it is coupled to the guide rod at top of pump. Lower end of pump rod is furnished with $\frac{1}{2} \times \frac{3}{8}$ -inch coupling. The bushing for the guide rod is renewable. In many pumps a complete new bearer has to be secured when the guide wears out.

The plunger and valve may be withdrawn from two-inch tubular wells after stuffing-box is removed. The union elbow coupling for underground connections can be turned to suit the direction of the pipe.

Fitted for other sizes of suction pipe when especially ordered.

Cylinders or working barrels for use with this pump are listed elsewhere.

Fig. 260
Plain
Windmill Top

Deming Force Pump Standards With Adjustable Base Will Lift and Force 35 to 200 Feet

In these pumps the standard is formed of pipe; the pipe to which the windmill top is attached, acting as an air chamber.

The differential plunger in the set length helps to make a smooth, uniform flow since the water is discharged at each stroke.

The one inch differential plunger is used instead of a stuffing box.

These pumps have a $1\frac{1}{4}$ -inch air chamber pipe and 1-inch discharge pipe.

The base is adjustable so that the pump standard may be made any desired length. Fig. 258 is identical with Fig. 260, except that it is fitted with a cog lever top for hand or windmill use and with enclosed gears. The spout can be swung to the left or right. Either pump will go into $5\frac{5}{8}$ -inch casing.

Fig. 260 is fitted with adjustable stroke lever for 6, 8 or 10-inch stroke. The cylinder is not included in the list price.

Figs. 260 and 258 have windmill rod $1 \times \frac{3}{8}$ inch, threaded $\frac{1}{8}$ -inch and coupled to $\frac{1}{8}$ -inch plunger rod with compression coupling.

The $\frac{1}{8}$ -inch rod is coupled to $\frac{1}{4}$ -inch piston stub rod which is threaded on the bottom $\frac{3}{8}$ -inch.

Cylinders or working barrels for use with these standards are illustrated and listed elsewhere.

Deming Force Pump Standards

Will Lift and Force 35 to 200 Feet
With Three Way Distributing Valve

Except for the addition of the three way distributing valve for underground discharge to tank, Figs. 261 and 259 are the same as Figs. 260 and 258 on the opposite page.

The three way valve being on the **outside** of the discharge pipe gives free passage to the water and greatly lessens the effort required for operation.

The stuffing-box for the three way valve is located **below the frost line**.

The gears on Fig. 259 are completely enclosed, making the pump entirely safe for children to operate. The cog lever insures a straight line movement of the piston rod.

The elbow on the three way valve can be turned either to the right or left as desired. The cylinder is not included in the list price.

Figs. 261 and 259 have windmill rod 1 x $\frac{3}{8}$ inch, threaded $\frac{1}{8}$ -inch and coupled to $\frac{1}{8}$ -inch plunger rod with compression coupling. The $\frac{1}{8}$ -inch rod is coupled to $\frac{1}{8}$ -inch piston stub rod which is threaded on the bottom $\frac{3}{8}$ -inch.

Deming Windmill Force Pump Standards

Fig. 415

With Underground Discharge

Fig. 415½

Will Lift and Force 35 to 200 Feet

These pumps were perfected to meet the requirements of the principal windmill manufacturers in the United States for better windmill force pumps with three-way valves than had heretofore been produced.

They have won their reputation on their merits, are the original pumps of this type and have been in use for more than thirty years.

The especial feature of these pumps is their distributing valve. The union elbow coupling for underground connection can be turned to suit the direction of the pipe, so that water can be discharged underground without danger from freezing. The distributing valve is operated by the hand wheel above the discharge spout.

The air chamber pipe on these pumps is 1½ inches diameter.

With Fig. 415, the plunger can be withdrawn from 2-inch tubular wells by removing the stuffing box.

Fig. 415½ has differential plunger 1¼ inches diameter instead of stuffing box and gland. When used with 2-inch tubular wells the valves may be withdrawn without disturbing the pipe connections.

These standards may be fitted for 1, 1¼, 1½ or 2-inch suction pipe and ¾, 1 or 1¼-inch underground discharge pipe, but always as listed unless otherwise ordered. Fitted with 1¼-inch steel well rod and reducing coupling, so that ¾-inch rod can be used if desired.

Cylinders or working barrels for use with these standards will be found elsewhere.

Deming "Straight-Line" Working Heads

Illustration shows Fig. 1717, No. 1, with Air Chamber about to be replaced, after installation has been made

Suggestions for Installing

Our "Straight Line" pumps and working heads possess especial features of accessibility, ease of operation, convenience, simplicity and durability unequalled by any other pumps on the market. The illustration shows how easily this type of pump may be installed. Following are a few simple directions.

To install in well put a length of pipe and rod on cylinder and remove air chamber from base. Place pipe and cylinder in well, using necessary tools to hold pipe while installation is being made; then place base over well and draw pipe and rod up through base. Add desired lengths of pipe and rod, dropping them down through base; screw pipe flange to last thread of pipe. Pump base will then support entire weight of cylinder and pipe. Remove plunger rod from crosshead; connect it to cylinder rod, then place air chamber in position and bolt fast.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming "Straight-Line" House Force Pump

For Operation by Hand, Windmill or Pump Jack

Fig. 1700

Ease of operation, accessibility, convenience, simplicity and durability are the outstanding features of this pump. This "Straight Line" construction reduces the friction to a minimum, causes the pump to work smoothly and easily, and makes it practically proof against wear.

As illustrated, it may be operated by hand or windmill, but is also adapted for connection to any standard pump jack.

Fig. 1700 is intended for use in wells where the vertical suction distance is not greater than 25 feet. For discharge elevations see table below.

Specifications

CROSSHEAD is designed for use with hand, windmill or jack. The jack may be attached direct to crosshead or to windmill flat rod but preferably to crosshead.

STUFFING BOX AND GUIDE SUPPORTS are cast integral to insure permanent alignment.

STUFFING BOX is of the nut and gland type with brass gland.

PLUNGER has one leather, brass cage and valve, and iron follower. **PLUNGER ROD** is $\frac{3}{4}$ -inch brass-cased steel.

LOWER VALVE is a rubber-faced wing valve, guided by the cylinder bore, and can be easily lifted out with a piece of ordinary fence wire having bent end, after bearer and plunger are removed. See detail illustration of base.

UPWARD DISCHARGE on air chamber is fitted with union nut and galvanized malleable iron pipe tube.

BASE is bolted to the cylinder for convenience when installing.

BEARER AND AIR CHAMBER are each adjustable to three different positions.

ANTI-FREEZING. The lower valve is so constructed that it will trip upon contact with the plunger, permitting the water to drain from the cylinder back into the well. Therefore, to drain the pump see that the cock spout is open and raise the lever to its extreme height.

If pump is discharging into overhead tank, we recommend that a check valve be installed in the discharge line to prevent contents of tank from draining on such occasions.

Price below includes 1-inch Brass Bib Cock. If upward discharge only is wanted, deduct \$6.00 from list price.

Brass Valve Seat is regularly furnished on this pump.

Deming "Straight-Line" Windmill Force Pump Standard For Wells 200 Feet Deep or Less

Fig. 1716

As illustrated, Fig. 1716 may be operated by hand, windmill or pump jack. Our distinctive "Straight Line" construction reduces friction to a minimum, causes the pump to work smoothly and easily and makes it practically proof against wear.

Specifications

CROSSHEAD is designed for use with hand, windmill or jack. The jack may be attached direct to crosshead or to windmill flat rod, but preferably to crosshead.

PISTON ROD, No. 1 is $\frac{3}{4}$ -inch cold-rolled steel; No. 2, $\frac{1}{2}$ -inch.

GUIDE SUPPORTS AND STUFFING BOX are cast integral to insure permanent alignment.

STUFFING BOX is of the nut and gland type with brass gland.

BEARER is adjustable to three different positions.

SEPARATE FLANGE BETWEEN BASE AND AIR CHAMBER for attaching drop pipe.

BACK OUTLET placed opposite discharge, for connecting to elevated tank.

Price includes one iron body compression cock. If plain spout is desired instead of cock spout, deduct \$2.50 from list price.

We recommend that Deming iron, brass-lined or brass cylinders be used with this standard.

The largest size plunger which can be withdrawn through the No. 1 size is $1\frac{3}{4}$ -inch; through the No. 2 size is $2\frac{1}{4}$ -inch.

Fig. 1716 may be fitted with air compressor at \$15.00 extra list (Cipher, OILET), as shown on page 76, for use with pneumatic water systems.

For information concerning how to install this standard, see page 70.

Fig. 1716 may be arranged to discharge into underground pipe by using a tee in the drop pipe the required distance below the ground. A shut-off should be placed in the underground pipe to check the flow when desired.

Fig. 1717

Deming "Straight-Line" Working Head

For Wells 200 Feet Deep or Less

Illustration shows No. 2 size

This is a self-contained high grade power working head for operation by hand, windmill, gasoline engine or electric motor. Our distinctive "Straight-Line" construction, so called from the two guide rods on which the crosshead operates, insures minimum wear on packing and piston rod. It also prevents cramping of connecting rods which often occurs with the ordinary pump jacks, due to the twisting of the crosshead out of alignment.

Specifications

STANDARD: Cast iron, with bronze-bushed shaft bearings.

DROP PIPE FLANGE between base and air chamber.

GUIDE SUPPORTS AND STUFFING BOX are cast integral to insure permanent alignment.

STUFFING BOX is of the nut and gland type with brass gland.

CROSSHEAD: Cast iron; arranged to attach lever for hand operation. Can be supplied with windmill rod. By removing pins, connecting rods may be laid back for operation by hand or windmill.

CONNECTING RODS: Cold-rolled steel with cast-iron ends. Lower end babbitted.

DISCHARGE COCK: Cast iron, compression type, with brass valve seat and brass nut and screw.

CRANK DISC: Cast iron.

CRANK GEAR: Cast iron. Teeth cut from the solid.

PINION: Steel; teeth cut from the solid.

CRANK AND PINION SHAFTS: Cold-rolled steel.

OIL CUPS: For crank shaft and pinion shaft bearings.

CRANK PINS: Steel.

GEAR GUARD: Cast iron, enclosing gear and pinion.

CRANK SHAFT AND PINION SHAFT BEARINGS have removable bronze bushings.

PISTON ROD: Size No. 1 is $\frac{3}{4}$ -inch; No. 2 is $\frac{7}{8}$ -inch cold-rolled piston rod steel, threaded for both wood and steel pump rod. *When using wood rod, cut off steel rod thread.*

No. 1 size is fitted for $\frac{5}{8}$ -inch wood rod coupling and $\frac{7}{8}$ -inch steel rod; No. 2 size for $\frac{7}{8}$ -inch wood rod coupling and $\frac{1}{2}$ -inch steel rod. The largest size plunger which can be withdrawn through the No. 1 size is $2\frac{1}{4}$ -inch; through the No. 2 is $2\frac{3}{4}$ -inch.

Fig. 1717 may be equipped with air compressor at \$15.00 extra list (Cipher, OILET), as shown on page 76, for use with pneumatic water systems. On page 195, the No. 2 size of this head is listed with complete hydro-pneumatic system. If desired to operate head by windmill power, specify windmill flat rod at 60 cents extra list.

For information concerning how to install this head see page 70.

Deming "Straight-Line" Power Working Head

Fig. 1718

With Underground Discharge

Fig. 1718 is a very substantial working head for operation by windmill, gas engine or electric motor. It is good for 400 pounds plunger load. The large pipe air chamber enables pump to discharge into long discharge pipe without undue strain on the working parts.

Specifications

BASE AND SHAFT BEARINGS are cast integral. Bearings are equipped with removable brass bushings.

GUIDE SUPPORTS AND STUFFING BOX are cast integral to insure accurate and permanent alignment.

CROSSHEAD: Cast iron; arranged for attaching lever for hand operation. Can be supplied with windmill rod. By removing pins, connecting rods may be laid back for operation by hand or windmill.

GUIDE RODS: Cold-rolled steel.

CONNECTING RODS: Cold-rolled steel with cast-iron ends, and lower end babbitted.

CRANK GEARS: Cast iron; teeth cut from the solid.

CRANK DISC: Cast iron.

CRANK AND PINION SHAFTS: Cold-rolled steel.

GEAR GUARD: Encloses gear and pinion.

Underground is a cast-iron manifold to which is attached stuffing box with brass gland, air chamber pipe, hydrant pipe, underground discharge, hydrant valve and case, drop pipe flange, plunger rod through stuffing box, threaded for $\frac{1}{8}$ -inch steel rod.

Fig. 1718 may be equipped with air compressor at \$15.00 extra list (Cipher, OILET), as shown on page 76, for use with pneumatic water systems. If desired to operate head by windmill power, specify windmill slide rod at 60 cents extra list.

Deming "Straight-Line" Power Working Head

With Underground Discharge
For Wells 200 Feet Deep or Less

Fig. 1719

Fig. 1719, as illustrated above, is adapted for use where a discharge spout at the well is not required.

The machine is substantially made with well guarded gears cut from the solid, and 2-inch outlet located three feet below the base. The drop pipe acts as an air chamber.

The connecting rods may be detached and the head operated by windmill in connection with our windmill slide head, Fig. 390. Windmill connection furnished when specified at \$1.50 extra list.

When specified, Fig. 1719 will be equipped with air compressor (Cipher, OILET) as shown on page 76 for use in Hydro-Pneumatic systems at \$15.00 extra list.

If it is desired to operate this head by windmill power, specify windmill flat rod, at 60 cents extra list.

No. 1 size is fitted for $\frac{5}{8}$ -inch wood rod coupling and $\frac{1}{4}$ -inch steel rod; No. 2 size for $\frac{3}{8}$ -inch wood rod coupling and $\frac{1}{2}$ -inch steel rod. *When using wood rod, cut off steel rod thread.*

Plunger rod No. 1 is $\frac{3}{4}$ -inch cold-rolled steel; No. 2 is $\frac{1}{2}$ -inch.

Deming "Straight-Line" Shallow Well Power Pump

For 22 Feet Suction Lift and 125 Feet Discharge Elevation

Fig. 1720

Fig. 1720 is for use in shallow wells, 22 feet deep or less. It is especially suited for tank service, creameries, pneumatic water systems and general water supply.

Specifications

BASE AND SHAFT BEARINGS are cast integral. Bearings are equipped with removable brass bushings.

CYLINDER: Brass, with one leather brass plunger.

GUIDE SUPPORTS AND STUFFING BOX: Cast integral.

STUFFING BOX: Nut and gland type with brass gland.

GUIDE RODS: Cold-rolled steel.

CONNECTING RODS: Cold-rolled steel with cast-iron ends. Lower end babbitted.

CROSSHEAD: Cast iron; arranged to attach lever for hand operation. Can be supplied with windmill rod. By removing pins, connecting rods may be laid back for operation by hand or windmill.

SPECIAL AIR COMPRESSOR
Furnished at Extra Cost
(See reference below)

CRANK DISC: Cast iron.

CRANK GEAR: Cast iron; teeth cut from the solid.

PINION: Steel; teeth cut from the solid.

PISTON ROD: Cold-rolled steel.

When specified, we will equip Fig. 1720 with air compressor (Cipher, OILET), see illustration above, for hydro-pneumatic service, at \$15.00 extra list.

If it is desired to operate this head by windmill power, specify windmill flat rod at 60 cents extra list.

Deming Cylinders or Working Barrels

Section of a Typical Brass-Lined Cylinder

The thought which is responsible for the old adage "A chain is no stronger than its weakest link," may be well applied when speaking of pump construction, for no pump is better than its cylinder. If the cylinder is defective, the pump is certain to be condemned.

The pump cylinder is sometimes designated as the "working barrel" or "working section" because it performs the actual work of bringing the water from the depths of the well to the surface. The pump top or standard is of secondary importance to the cylinder.

Attention is directed to the detail view on this page showing a typical cylinder. This will give a clear understanding of the location and function of each of the necessary parts of the cylinder. The engraving represents our brass-lined cylinder, Fig. 308, with leather lower valve.

We are extremely careful in the manufacture of Deming cylinders, making all parts to exact gauges so that repairs, should they be needed, will always fit. All cylinders undergo a rigid inspection before they leave our factory.

The lists on the following pages give the sizes of pipe for which the cylinders are fitted, but if other sizes of pipe are to be used, we can generally fit the cylinder attachments to suit, for which we will make an extra charge. However, we recommend that the cylinders be fitted as listed, as we have found from experience that they are best adapted for the sizes of pipe as given in the lists. In order that the pump operates properly, all parts of the cylinder must be in perfect condition, and the joints should be air tight.

Deming Iron Cylinders

Deming iron cylinders are finished on special machines, leaving a high polish in the bore and retaining the chilled surface of the iron. This makes a cylinder which is not easily affected by rust and which wears longer than iron cylinders finished in the ordinary way. Only skilled workmen — men who have been in our employ for years — are permitted to work on Deming cylinders.

Deming Brass-Lined Cylinders

When rust accumulates on an iron cylinder, the plunger leathers are apt to become more or less affected by it. To overcome this difficulty, the brass-lined cylinder was originated about 1876 and was a tremendous success right from the start. Deming brass-lined cylinders are made similar to the iron cylinders, the shell being bored out smoothly and enough to insert a piece of seamless drawn polished brass tubing which is forced into the iron shell and then expanded at both ends — "swaged" — to position. These cylinders possess the smoothness of the brass tube cylinders and are not so likely to become injured by external pressure. They will not rust, "pit" or break.

Deming Brass Tube Cylinders

Many of our customers prefer brass tube cylinders for the reason that the brass threads do not rust, and it is therefore less trouble to take off the caps when new leathers are needed or other repairs are to be made. The iron threads are likely to be rusty and offer some difficulty when the caps are to be removed. The shell of a Deming brass tube cylinder consists of a heavy seamless drawn polished brass tube with iron or brass attachments as desired.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Plungers for Deming Cylinders

The plunger constitutes a very important part of the cylinder. Great care must be exercised in the manufacture of the plunger and its valve, or the cylinder will fail to give good service. Deming plungers are constructed by workmen especially skilled in making and assembling this particular article.

All Brass
Plunger Used
With Fig. 324

Specifications of Deming Plungers

"A" PLUNGER HAS ONE CUP LEATHER and $\frac{3}{8}$ -inch follower, as illustrated.

"J" PLUNGER HAS TWO CUP LEATHERS and $\frac{1}{2}$ -inch follower, as illustrated.

The "A" and "J" Plungers may be had as follows:—either all iron; or with iron follower, brass cage and valve; or all brass.

Plunger used in Fig. 311 artesian well brass cylinder has two cup leathers, and ball valve. FURNISHED REGULARLY ALL BRASS.

Plunger used in Fig. 324 artesian well brass cylinder has four cup leathers and ball valve. FURNISHED REGULARLY ALL BRASS.

Deming Brass Valve Seat

Will not break, chip, flatten, corrode, wear out or become loosened from the cap.

Furnished regularly on all Deming Cylinders except Fig. 314.

The construction of this seat is such that no particles of sand and gravel will find permanent lodgment upon it. The Deming brass valve seat is swaged to position—expanded at both ends—which insures its permanence. This seat is so constructed that an extra hard surface is secured for the face, making it impervious to the action of the water or the pounding of the valve.

Many times we have had Deming cylinders returned to us in which the valve leathers had worn out after long usage, leaving iron valve weight to pound upon the brass seat, *but without affecting the seat in any way whatever* because the Deming seat has a harder surface than any iron or cast brass seat.

Bottom attachment of a Deming cylinder cut open to show Deming Brass Valve Seat. This clearly illustrates how it is impossible for the seat to "break, chip, flatten, corrode, wear out or become loosened from the cap."

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Lower Valve and Brass Valve Seat

Special Lower Cylinder Valve, Fig. 335 Western Style

Fig. 335

The special lower cylinder valve, Fig. 335, is for use with our iron, brass-lined and brass body cylinders having OUTSIDE ATTACHMENTS, Figs. 300, 308 and 312, listed elsewhere. Any of these cylinders will be furnished with Fig. 335 when so ordered, at extra list prices given below. The poppet valve is leather faced, insuring a perfect seat. Many dealers find it desirable to carry this cage and valve in stock as an extra.

Deming Improved Deep Well Air Cylinder Fig. 306

(Patented)

For Pneumatic Water Supply in Connection with
Compression Tank Systems

The use of compressed air tanks supplied from deep wells by windmill or other power pumping appliances has hitherto been seriously hindered by lack of a reliable contrivance to supply air for recharging the tank. This hindrance has recently been overcome by the use of an auxiliary air pumping cylinder located in the discharge pipe between the working barrel and the pumping head.

We offer the best cylinder of this type in our Fig. 306 Auxiliary Air Pumping Cylinder. The illustration shows a sectional view with an air cock in center casting. The air cock must be located above the water, or piped to some point above to prevent cylinder from pumping water instead of air.

These cylinders may be used with any size of working barrels, but we advise their use with the size of pipe for which they are fitted.

Lower Caps and Valves for Deming Cylinders

Hinged Leather Lower Valve

The hinged leather valve which we use on all our cylinders with outside caps is too well known to require detailed description. The very best of material and workmanship is used in the construction of this valve which has for many years given the best of satisfaction.

Hinged Leather
Lower Valve

Lower Cap and Disc Valve with Split Cage For Inside Capped Cylinder, Fig. 322 (Patented)

Our special leather faced disc valve with split cage is furnished regularly on our Fig. 322 inside capped cylinder. The split cage makes it impossible for the valve to get out of place when in the cylinder. The valve is very easy to remove and repair when the cap is unscrewed from the cylinder. The cage and valve are made of iron on the cylinders with iron attachments. Cylinders with brass attachments have brass cage and valve. The Deming brass valve seat is furnished on this iron lower cap.

Special Lower Cap and
Disc Valve with
Split Cage
(Patented)

Lower Valve for Fig. 311 Artesian Well Brass Cylinder

This ball valve is made tapered to fit the lower attachment of the cylinder. As an added safeguard against leakage, it is also supplied with leather cup packing. With this construction, the valve can be drawn through the top of the cylinder without removing the attachments.

Lower Valve for
Fig. 311

Lower Valve for Fig. 324 Artesian Well Brass Cylinder

This valve is in all respects similar to the valve used in the Fig. 311 cylinder except that we pack it with rings of leather which are turned to fit the cylinder, which adapts Fig. 324 for heavier duty than Fig. 311.

Lower Valve for
Fig. 324

Deming Improved Iron Cylinders or Working Barrels With Outside Caps and Brass Valve Seats

Fig. 300

Fig. 300 is made with hinged leather lower valve and with Deming BRASS VALVE SEAT. The construction of the Deming brass valve seat prevents particles of sand and gravel from finding lodgement and interfering with the proper working of the valve.

Deming Seamless Brass Body Cylinders

With Inside Caps and Special Patented Disc Lower Valve

Fig. 322

In these cylinders the top and bottom attachments screw *INSIDE* the cylinder, which brings the attachments flush with the shell of the cylinders and adapts them for use in wells of smaller diameter than the corresponding size of cylinder fitted with outside caps.

The Deming brass valve seat is furnished on this cylinder. Our special disc lower valve as described on page 81, is used with this cylinder instead of the hinged leather lower valve.

Fig. 322—12" in length is fitted with "A" (One Leather) Plunger. Longer than 12" have "J" (Two Leather) Plungers.

The Deming "Whitecap" Seamless Brass Body Cylinder With Inside Attachment and Iron "A" Plunger For Small Diameter Wells

Fig. 314

For the benefit of pump dealers, we have gotten up this special line of brass body cylinders designated as Fig. 314. These cylinders as will be seen by the specifications are made in the popular sizes — $2\frac{1}{4}$ -inch, $2\frac{1}{2}$ -inch, $2\frac{3}{4}$ -inch and 3-inch, and in two lengths of stroke, 6-inch and 10-inch. The longer stroke cylinders are adapted for adjustable stroke windmill pumps, and as these cylinders are all made with inside attachments, they will give the greatest capacity for drilled wells of small diameters. As this is intended to be a popular line of cylinders, they are made only as listed and as shown in the engravings with iron parts excepting the brass tube shell. The cylinder attachments are all fitted for $1\frac{1}{4}$ -inch pipe. All details in connection with these cylinders have been carefully considered as to the convenience of the Dealer and the User. It is a thoroughly practical line of cylinders and embraces the sizes that are in most common use.

To distinguish the Deming Special "Whitecap" Brass Body Cylinders from our standard line, the Caps of these Specials will be painted white. For our standard cylinders, made in varied sizes and lengths of stroke, see other pages in this section of the Catalogue.

Deming Special Artesian Well Brass Cylinder

With Bronze Ball Valves

Fig. 311

Fig. 311 Cylinder is made of seamless drawn brass tubing with cast bronze attachments, the top attachment being threaded for standard pipe of the next size larger than the inside diameter of the cylinder, to permit the withdrawing of the plunger and lower valve without the necessity of removing the pipe and cylinder. The bottom attachment is threaded for suction pipe or strainer. The plunger and lower valve are made of bronze, with bronze ball valves, and the plunger has two cup leather packings. The plunger is provided with a steel pin connection for wood rod coupling as listed unless ordered otherwise.

These cylinders are somewhat lighter and shorter than Fig. 324 cylinders of the same diameter and stroke, though in every way equal in the high quality of material and workmanship. They are suitable for use in wells of medium depth with any power or steam-driven working head.

NOTE.—For convenience in shipping the plunger and lower valve are screwed together, and must be disconnected before cylinder is lowered in the well.

HAND AND POWER PUMPS FOR ALL USES

Deming Standard Artesian Well Brass Cylinder

Fig. 324—With Bronze Ball Valves

Fig. 324 Cylinder, or Working Barrel, is made of seamless drawn brass tubing with cast bronze top and bottom attachments, the top attachment being threaded for standard wrought iron pipe connections the next size larger diameter than the cylinder, to admit of withdrawing the plunger and lower valve. The bottom attachment is threaded for suction pipe or strainer. The plunger and check are of bronze, with bronze ball valves, and the plunger has four cup leather packings. With these cylinders we recommend using Fig. 636 wood sucker rod, listed on page 99, the plunger being provided with a steel pin connection for wood rod coupling as listed unless ordered otherwise. *For convenience in shipping, the plunger and lower valve are screwed together, and must be disconnected before cylinder is lowered in well.*

Unless otherwise specified top and bottom attachments of cylinders will always be threaded for standard pipe as listed below. *When so ordered the 5¼ inch cylinder will be fitted for 5½ inch casing, and the 6¼ inch cylinders for 6½ inch casing.*

Deming Seamless Brass Tube Cylinder

With Removable Lower Valve

Fig. 1311

Fig. 1311 cylinder is made of seamless drawn brass tubing with cast-iron attachments, the top attachment being threaded for standard casing of the next size larger than the inside diameter of the cylinder, to permit the withdrawing of the plunger and lower valve without the necessity of removing the pipe and cylinder. *Bronze attachments furnished at extra cost.* The bottom attachment is threaded for suction pipe or strainer. The plunger and lower valve are made of machine-finished, bronze castings and are designed with the largest possible waterway.

The plunger has two cup leather packings and the lower valve one. The valves, valve seats and followers are interchangeable; valves are leather-faced. The lower valve is held securely in place by stiff springs which are so designed that they lock the lower valve seat and make it impossible for it to unscrew and drop off of the valve stem. To remove plunger and lower valve, simply draw out the plunger. The lower valve rod, which extends up through the plunger and is fitted with lock nuts, will, in turn, draw out the lower valve.

This simple construction does away with the difficulty so often experienced in trying to screw the plunger down onto the lower valve cage, as it is necessary to do on nearly all other makes of cylinders.

Deming Windmill Irrigating Cylinders For Wells 100 Feet Deep or Less

Fig. 380
For Spiral Riveted Pipe
(Flange of Cylinder Fits
Flange of Pipe)

Plunger
For Fig. 380

Lower Valve
For Fig. 380

Fig. 1380

These cylinders may be operated by windmill or other power. They are intended for use in raising large quantities of water for irrigation or drainage purposes.

Fig. 380 has suction and discharge fitted for wrought iron pipe as listed. The top flange is regularly drilled for Abendroth and Root Special Riveted pipe as listed below.

Fig. 1380 has an extra heavy brass liner; all brass plunger; brass poppet lower valve and brass valve seat. The extended flange at top is drilled for supporting the cylinder on a framework to relieve the connecting pipe of the weight of the cylinder. Flanges on the 6 and 8-inch cylinders have $\frac{1}{8}$ -inch holes; the 10-inch and 12-inch cylinders have $\frac{5}{8}$ -inch holes.

Deming Oak Tanned Pump Leathers Packed in Cartons of One Dozen Each

Showing Carton of One Dozen
Lower Valve Leathers

Showing Carton of One Dozen
Cup Plunger Leathers

Good leathers are just as essential to the success of a cylinder as a good cylinder is essential to the success of a pump. By some manufacturers, very little attention is given to the matter of leathers, although it is a subject of supreme importance, since much depends upon the performance of the leathers.

It is possible to buy pump leathers at a very low price, made up from scrap or clippings, but in the manufacture of Deming leathers, we use only the very highest grade of material. We buy the full sides from a tannery which makes a specialty of pump leather, and cut our own plungers and valve leathers, washers, etc. As the sides are especially treated for us, durability is assured, and by cutting them ourselves, we secure absolute accuracy. We have been cutting our own pump leathers for more than thirty years.

Deming cup and valve leathers are packed in pasteboard cartons. Dealers find these cartons to be very convenient. The kind, quantity and size of leathers contained are printed plainly on the front of each box so that the leather inventory can be taken at a glance. Being square cornered, these cartons will not roll around on the shelves and can be stacked one above the other.

Complete Price Lists are given on the opposite page for lower valve leathers, ring packings, flat plunger leathers and cup or crimped plunger leathers.

Deming "Marine" Irrigating Pumps

Will Lift 20 Feet

Fig. 475

With Bottom Suction

Fig. 476

With Side Suction

Fig. 475 is adapted for raising large quantities of water, short distances, with windmill or other power. It has a flanged base to fasten to platform or foundation. The bottom flange is threaded for suction pipe. The plunger can be withdrawn after removing the top cap. The plunger valve is metal, leather faced.

Fig. 476 is like Fig. 475 except that it is made with a tall base and has a flange at one side threaded for suction pipe.

Standard Weight and Extra Strong "Spellerized" Steel Pipe Black and Galvanized

"SPELLERIZING"

In order to lessen the natural tendency of pipe to corrode, all sizes of "NATIONAL" Pipe below 4 inches are "Spellerized." This is a special roll-knobbling process whereby the heated bloom is subjected to the action of rolls having regularly shaped projections on their working surfaces, and then to the action of smooth-faced rolls. These successive operations are repeated until a uniform and dense texture is obtained, the metal as a consequence becoming better adapted to resist corrosion, especially in the form of pitting.

"Spellerizing" is NOT a mere experiment, but after several years in actual service, results have proved the value of uniform material for pipe, and this is the effect of "Spellerizing."

The larger sizes of pipe are also uniform in texture as the result of special manufacturing processes, but the smaller sizes only are "Spellerized" to counteract the greater danger from corrosion to the thinner walls.

We carry large stocks of all sizes up to and including 4 inches, and can make shipment the same day order is received.

Deming Wood Sucker Rods and Pin Connections

Fig. 636 Wood Sucker Rods are made of the best material obtainable, octagon in shape, and are lighter than solid steel or pipe rods. Prices include rods with couplings attached, and are for standard lengths of from 18 to 20 feet each. Shorter lengths furnished at proportionate increase in price. When wanted, rods are furnished with galvanized couplings and copper rivets at extra price. Fig. 636 Rod Couplings are of forged wrought iron with threaded box and pin joints.

Deming Strainers, Check and Foot Valves

Vertical and Horizontal Check Valves

Where the suction lift is high or the suction pipe long it is desirable to use a foot valve as this will insure quick starting of the pump by maintaining the suction pipe full of water.

Fig. 325,
Vertical

Smaller, Screwed

Foot Valves With Bolted Strainer

It is well also to have a strainer at the end of the suction pipe to prevent the intake of the larger particles of foreign matter which would tend to clog the pump valve. Fig. 328 combined foot valve and strainer answers this purpose to very good advantage. We can furnish sizes larger than 2-inch in either the screwed or flanged type.

Deming Pump Bracket and Cast Iron Sinks

Pump Bracket for Flat and Roll Rim Sinks

Will attach to the rim of an ordinary painted or enameled flat or roll rim sink for supporting a pump, and can be placed on either end. The shelf is substantial and neat in design. The combination consists of the pump shelf and bracket, and has a bead around the outer and inner edges, so that all waste water will drain into the sink. It can be quickly placed in position by means of the set screws, and it can also be adjusted to the proper level. A small piece of sheet rubber packing or leather should be placed between the shelf and the sink so as to prevent marring the enamel. The suction pipe of the pump passes through opening of the shelf.

Rubber Suction and Discharge Hose

"Deco" $\frac{1}{2}$ -inch Special High Pressure Hose for Spraying—
Good for 250 Pounds Working Pressure

"DECO" $\frac{1}{2}$ -INCH SPECIAL SPRAY HOSE FOR 250 POUNDS WORKING PRESSURE

This is a high grade continuous web hose made up especially for us and according to our specifications. It is used with hand and power sprayers and is guaranteed for 250 pounds working pressure to the square inch. We can furnish this hose in any desired lengths. Standard reel, 500 feet. List price per foot $\frac{1}{2}$ -inch \$0.25

Spiral Wire Suction Hose

SPECIAL WIRE SUCTION HOSE

We carry in stock spiral wire lined suction hose as follows:

- 1-inch and $1\frac{1}{4}$ -inch in 10-foot lengths.
- 2-inch in 15, 20 and 25-foot lengths.
- $2\frac{1}{2}$ -inch and 3-inch in 15-foot lengths.

Deming Automatic Pressure Regulators

For Small D. C. and A. C. Motors

Fig. 1508
List Price, \$24.00

Fig. 1608

Designed for the automatic control of electric motors which drive pumps operating in connection with hydro-pneumatic water systems. Positive in operation and absolutely reliable. Suited for use with motors which may be thrown directly across the line and of capacities not to exceed the listing below.

Connection with the pressure tank should be by an independent pipe from the tank and not from the discharge pipe from the pump. Fig. 1508 is fastened to the wall, or other vertical support, by screws, while Fig. 1608 is supported by the $\frac{3}{8}$ -inch supply pipe and requires no other support.

They are suitable for use with motors which may be thrown directly across the line, and of capacities not exceeding the following:

The Fig. 1508 switch is regularly furnished on all of our electric-driven water systems except the "Marvel" outfits, Nos. 1685 and 2085, on which the Fig. 1608 switch is regularly supplied.

Typical Deming Double-Acting Force Pump

Fig. 601 (In Section)

Detail of Triumph Pump

The pumps in this section are so varied in their construction and use that it is impossible to show a sectional view of any one pump which will be representative of all. However, on this page we have illustrated Fig. 601 as being a typical double-acting force pump. It discharges water on both strokes of the lever and will lift and force from 60 to 75 feet, depending upon conditions. All of the pumps listed in this section have the cylinder or working parts located in the body of the pump so that no independent cylinder will be required.

None of these pumps, therefore, are intended for a greater suction distance than 22 feet, and in the case of diaphragm pumps, not more than 20 feet. In most instances, when using pumps shown in this section, it will be found advisable to attach a strainer to the suction pipe or hose to keep particles of sand, gravel, etc., from being drawn into the pump.

Deming "Triumph" Double-Acting Force Pumps

Fig. 601

Flat Air Chamber

Fig. 602

Fig. 601 is a heavy duty double-acting force pump, fitted with single malleable iron lever with wood handle, and is particularly well adapted for use in mines, factories, warehouses, for fire protection, and for use on vessels, in pumping either hot, cold, acid or salt water. The piston rod is brass, and works through a bolted stuffing box and gland. The piston is regularly fitted with leather crimps, but for hot water is furnished with canvas crimps. Valves and seats are of brass, and the cylinder is brass lined. All brass cylinder, or entire water end of brass, furnished as ordered. Standard air chamber is round, but flat air chamber is furnished to order without extra charge. All pumps are provided with brass vent plugs to prevent freezing.

Fig. 602 is identical in construction with Fig. 601, except that it is provided with two malleable iron levers, and is made in the three larger sizes only. The No. 4, with 5-inch diameter cylinder, has a displacement somewhat in excess of 100 cubic inches, thereby more than meeting the requirements of the U. S. Steamboat Inspection Service, which calls for one pump of 100 cubic inches capacity on vessels of 200 tons or less, and two pumps on vessels of over 200 tons. These pumps are suitable for pressures up to 50 pounds.

The suction and discharge of Figs. 601 and 602 are regularly fitted for iron pipe; fitted with brass hose couplings at extra price. *Extreme suction lift should not exceed 25 feet.*

Net weights of these pumps are as follows: Fig. 601 No. 1, 94 lbs.; No. 2, 96 lbs.; No. 3, 115 lbs.; No. 4, 175 lbs.; No. 5, 220 lbs.; Fig. 602 No. 3, 150 lbs.; No. 4, 200 lbs.; No. 5, 270 lbs.

Deming "Giant" Double-Acting Thresher Tank Pumps Will Lift and Force 60 Feet

Fig. 554

Fig. 554½ with Cog Lever

For the use of threshermen in filling their wagon tanks quickly with water for the purpose of supplying the steam engine boiler; for a contractor's ditch pump; for garden irrigating, and for mine and tank service, the "Giant" is unexcelled.

Discharge spout is fitted with hose tube for hose. For use with iron pipe, we will furnish when specified, tubes threaded for iron pipe, instead of spout and hose tubes, as illustrated. This gooseneck may be turned for discharge on either side of the pump. The capacity is from one to two barrels per minute, depending on the number of strokes. Valves are metal, faced with rubber. Cylinder is highly polished. The long wood lever insures easy operation. The polished steel piston rod operates through a brass stuffing-box gland.

The caps over the discharge valves can be removed to examine or repair the discharge valves by inserting a stick or rod between the projections. No wrench is necessary. These pumps are double-acting and deliver water on every stroke.

Figs. 554 and 554½ are identical except that Fig. 554½ has cog lever instead of plain lever. The cog lever makes it possible to operate the pump with a minimum degree of friction.

Iron cylinder is regularly supplied on these pumps, but if specified brass-lined cylinder will be furnished at \$5.00 extra list.

For Fig. 554½ add \$2.00 to list prices below.

Deming "Marine" Bilge Pumps

For Suction Lift of 20 Feet or Less

Fig. 470
Bottom Suction

Fig. 471
Side Suction

These Pumps are adapted for raising large quantities of water by hand from the bilge well of vessels, from stone quarries and coal mines, cellars and ditches, and for irrigating purposes, where the water is not over 20 feet vertically below the pump. They are much used by contractors in removing water from excavations of various kinds.

There are three fulcrums, as shown on the engraving, whereby the pump may be operated with the lever in any one of three positions. The lever is substantially constructed of wrought iron, bent, so that its position may be reversed in the socket and thus it becomes a vertical lever which, in some instances, will be found quite convenient.

The Valves are rubber-faced, and are made large so as to give ample water way. They are easily removed for repairing. The Cylinder is brass lined. A flange, threaded for suction pipe, is bolted to the base of the pump. At a slight additional cost, we fit these pumps, when ordered, for suction hose.

The Suction may be fitted for other sizes of pipe, but is always fitted as listed, unless otherwise ordered.

Suction Hose Nipples furnished when ordered. Extra list for No. 2, \$3.75; No. 4, \$5.00.

Deming Improved Diaphragm Suction Pumps

Fig. 472, Bottom Suction

Fig. 473, Side Suction

Fig. 472 Bottom Suction Pump is made with diaphragm of the best quality of rubber; iron suction and discharge valves are rubber faced, both being easily removable. The waterways are large and practically non-chokable. The suction is fitted for iron pipe.

Fig. 473 Side Suction Pump is similar in construction to Fig. 472, but the suction connection is at the side, and is fitted with nipple for connecting iron pipe, which is also the thread generally used for hose coupling.

A strong wrought iron lever is furnished with each pump, the lever being bent so that it can be used in a vertical or horizontal position, and the pump operated from either side.

For the use of contractors and others these pumps are invaluable for pumping out sewers, trenches, excavations, or places containing muddy or gritty water.

Fig. 337 Galvanized Strainer furnished without hose at \$1.90 list for 2½-inch, and \$2.65 for 3-inch. Hose couplings, extra diaphragms and gaskets furnished at reasonable prices.

Deming Power Diaphragm Pumping Outfit

Fig. 1473

Fig. 1473 Power Diaphragm Pump is especially recommended for the use of contractors or others, when it is necessary to handle quickly and economically large quantities of muddy or gritty water. The diaphragm is 12½ inches in diameter of best quality of rubber and the valves are of metal, rubber faced, both being easily renewable. The waterways are large and practically non-chokable.

Unless otherwise specified the side suction pump illustrated is furnished, and is fitted with nipple for connecting iron pipe, which is also the thread generally used for hose coupling. When ordered for bottom suction the list price is \$3.00 less than given below.

These outfits are furnished with either 1-H.P. or 1½-H.P. engines of the four-cycle type, with hit-and-miss governor and cooling hopper, these being very reliable and simple. The gears of the jack are machine cut from solid blanks to reduce friction and noise to a minimum.

The pump and engine are mounted on substantial wooden skids, as shown, for easy handling.

Deming Improved Siphon Force Pumps

With Brass Cylinder and Brass Piston Rod
Will Lift and Force 25 to 100 Feet

Fig. 385

Our Siphon Pumps are so constructed that the cylinder and valves are at all times submerged and consequently always primed.

In Fig. 385 the outer case is provided with a hand-hole at the base, covered by a plate. To gain access to the lower valves, remove the hand-hole plate. Access to the plunger may be secured by removing the stuffing-box cap. Plunger may then be withdrawn. This construction makes possible the removal of the plunger and lower valve without in any way disturbing the pipe connections.

Swing jointed rod coupling will be furnished when so ordered at extra list prices as follows: 3-inch and smaller, \$1.00 extra; 3½ and 4-inch, \$1.50 extra; 5 and 6-inch, \$2.00 extra.

Fig. 386 is in all respects identical with Fig. 385, except for the addition of a hand lever.

Gooseneck spouts furnished at \$1.00 extra list.

Deming Improved Siphon Force Pumps

With Submerged Cylinder

Will Lift and Force 25 to 75 Feet

Fig. 320

Fig. 321

Fig. 320, Submerged Cylinder Pump, for use in places where it can be located within twenty-five feet of the water, has been for years a favorite. It is always primed, therefore will draw water a longer distance than ordinary pumps. It must be protected from frost. The piston-rod is arranged for power, and a forked coupling for attaching to a wind mill wood-rod is also furnished.

Fig. 321 is identical with Fig. 320, except that it has windmill top and lever for hand use. Goose neck spout will be furnished at an extra list price of \$1.00 for Nos. 1 to 4.

Deming Siphon Windmill Force Pump

With Brass Cylinder
Will Lift and Force 25 to 75 Feet

Fig. 387

In this pump the brass working barrel is suspended in the iron case, thus forming a reservoir.

This reservoir is always filled with water and the pump is therefore always primed. In freezing weather this water can be drained off by removing drip screw and operating pump until water is all out of cylinder. Near the top of the iron case the pump is tapped for suction pipe. The plunger rod is brass cased, and the plunger, suction valve cage and seat are all brass.

The discharge pipe may be turned either to the right or to the left to suit conditions. All of the working parts may be removed by taking off the top cap which is fastened to the outer case by means of four bolts. The inner cylinder is of heavy seamless brass tubing.

Add \$1.00 to the list price if malleable forked rods are wanted instead of windmill slide.

Deming Windmill Force Pumps on Base

With Air Chamber and Cock Spout
Will Lift and Force 30 to 75 Feet

Fig. 430

Fig. 1430

Fig. 430 is a very heavy pump which may be used in connection with a windmill. It is also arranged for operation by hand. The base is tapped for iron suction pipe and is bolted to the stock. The air chamber is provided with an upward discharge.

When used in cold climates, freezing may be prevented by raising the lever to its extreme height which trips the valves and allows the water to escape from the cylinder. The working barrel or cylinder is located in the stock.

Fig. 430 has brass valve seat, brass cased piston rod and a cock spout threaded for hose. The bolt holes in the air chamber are so spaced that the spout can be turned 90 degrees either way. The bearer is also adjustable.

Fig. 1430 is similar to Fig. 430 except that it has a hand-hole in the base, giving easy access to the suction valve for examination or repairs.

Deduct \$2.50 from list price if cap nut on side discharge is wanted instead of cock spout.
Brass Valve Seats are regularly furnished on these pumps.

Deming "Little Giant" Hydraulic Pressure Test Pump

With Detachable Lever
For 800 Pounds Pressure

Fig. 566

This pump is built for pressures up to 800 pounds per square inch. All parts coming in contact with the liquid are made of brass. Fig. 566 has an extra long and powerful forged steel lever. It is much used for testing boilers, pipe lines, castings or for steam gauges, in connection with a master gauge.

Fig. 566 is regularly fitted for iron pipe but can be fitted with hose nipples at extra price when so ordered.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Hydraulic Force Pump for Plumbers

With Brass Valves
For 400 Pounds Pressure

Fig. 594

This pump is very convenient for plumbers to use for removing obstructions from drain pipes, etc. It is also well adapted for use as a reserve hand boiler feed pump on traction outfits. Should the injector refuse to work, then Fig. 594 would be available to pump water into the boiler and prevent an explosion. In certain localities the laws require an auxiliary feed pump, and Fig. 594 meets the requirements of these laws.

It has an extra long and powerful lever which may be turned so as to operate from either side. The suction and discharge valves are screwed to the cylinder.

Fig. 594 is very convenient for making a cold water test on boilers as a maximum pressure of 400 pounds can be obtained by its use.

Deming Gasoline Plunger Pumps

For Private Garages

Will Lift and Force 50 Feet

Figs. 725 and 726

To anyone desiring a low priced gasoline pump of small and medium capacity, these two pumps will commend themselves.

Fig. 725 will handle about $1\frac{3}{4}$ gallons of gasoline per minute when operated at 42 strokes. It has a special foot valve fitted for $\frac{3}{4}$ -inch suction pipe. When furnished without cock, the discharge connection is adapted for $\frac{1}{4}$ -inch pipe or $\frac{3}{8}$ -inch and $\frac{1}{2}$ -inch hose,

The base is adjustable, and the pump is, with the exception of the handle, made almost entirely of brass. The brass air chamber insures a steady stream. If a chain and padlock are used on the handle, thefts of gasoline will be prevented. It is fitted for $\frac{1}{2}$ -inch bibb cock. When ordered with stop cock, the cock is threaded for hose.

Fig. 726 has an all brass piston with cup packing. The stuffing-box is of the nut and gland type. The base is in two parts and is clamped to the cylinder so that pipe connections may be made without disturbing

Fig. 725

Fig 726

the pump. When ordered with stop cock, the cock is threaded for hose.

Fig. 726 also has a safety locking device which prevents children and others from wasting the gasoline and thereby endangering the garage. It is fitted for 1-inch suction pipe.

When the handle is pushed entirely down to locking position, the brass valve trips and the liquid flows back into the tank, leaving the pump entirely free.

On page 149 is shown a typical installation of a gasoline pump for garage use.

Deming Fire Protector

For Factories, Warehouses, Construction Camps, Etc.

Fig. 1668

Detail View of Pump

This handy little fire protector affords an ever ready means for the control of incipient blazes. Many thousands of these fire protectors have been supplied to the U. S. Government for use in camps and cantonments in this country and abroad; also on transports and other types of vessels.

Filling the tank of Fig. 1668 with a brine solution (or plain water where there is no danger of freezing) provides an effective means of fire control. A chemical fire extinguisher may not work in time of need, but this Fig. 1668 outfit *is always ready and will not fail.*

Specifications

TANK—Capacity 5 gallons; strongly and substantially built of galvanized iron and assembled with riveted joints. Ends of tank rolled over No. 9 wire. One-half of tank cover is hinged and provided with a catch. Bale is extra heavy and very rigid. Foot rest on tank keeps outfit immovable while pump is being operated. Tank is painted inside with two coats of "Insulite" and painted outside with one coat flat vermillion red and one coat bright red enamel.

PUMP—Is our "Prize" double-acting brass force pump with special air chamber; and "D" shaped handle. Has brass cylinder; brass ball valves; brass fittings and strainer and is securely fastened to the tank. May be easily removed from the tank by loosening three screws.

PERFORMANCE—Pump will throw solid stream 35 feet vertically. Three minutes of rapid pumping will empty the tank.

DIMENSIONS AND WEIGHT—Diameter of tank, 9 $\frac{5}{8}$ inches. Height of tank, 17 $\frac{1}{2}$ inches. Height overall with plunger on extreme down stroke, 27 inches. Weight complete, 8 $\frac{3}{4}$ pounds; boxed for shipment, 25 pounds.

EQUIPMENT—Three feet of $\frac{3}{8}$ -inch hose and brass fire nozzle for throwing solid stream only.

Outfits

Fig. 1668—With galvanized iron tank, as illustrated Cipher, KORET
Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Southern Well Force Pump

With Polished Cylinder in Stock
Will Lift and Force 35 to 100 Feet

Fig. 1274

Fig. 1274 is made with two fly-wheels; a crank shaft; babbitted bearings, and a guided rod. The air chamber is provided with an upward discharge fitted for the same size of pipe as the suction.

For pumping large quantities of water, the fly-wheel and crank are preferred in some localities to the usual lever, because all strokes are of equal length, and the pump discharges the full capacity at each revolution.

When equipped with either 2, 2½, 3 or 3½-inch cylinder, Fig. 1274 will lift and force, respectively, 100, 75, 50 and 35 feet. For Fig. 1274 fitted with independent cylinders for deep wells, see list below.

Where there is liability to danger from freezing, Fig. 1274 should not be used, except when in service as a deep well pump. If plain spout is wanted instead of cock spout, deduct \$2.50 from list.

Deming "Colonial" Quick Return Force Pump

With Fly-Wheel and Compensating Lever
Will Lift and Force 35 to 100 Feet

Fig. 277

By the combination of the slotted yoke or lever, and roller crank pin, the leverage is greater on the up stroke than with the ordinary crank, which makes it very easy to operate the pump. The arrow on the face plate indicates the direction in which the crank shaft should be revolved.

The cylinder and plunger are in the stock. If wanted for other than wrought iron suction pipe, the purchaser can easily arrange suction flanges to fit the bottom flange of the pump. The three-way discharge cock makes it possible to force water to an elevated tank or through the spout opening, as desired. For Fig. 277, fitted with independent cylinders for deep wells, see list below. When equipped with either 2, 2½, 3 or 3½-inch cylinder, Fig. 277 will lift and force, respectively, 100, 75, 50 and 35 feet. If plain spout is desired instead of cock spout, deduct \$5.00 from list.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming "Century" Complete Whitewashing Outfit

With Brass Working Parts

Fig. 644

The better the light, the more work an employee will do, and "brightening up" with whitewash has therefore been found to bring very satisfactory results in factories where the light is not good. Artificial lighting bills have been very materially decreased; in some cases as much as 25 per cent., by the application of whitewash or cold water paint.

When applied with a brush, the process is slow, laborious and often unsatisfactory. Using a Deming whitewashing outfit, the operation is simplified and is quickly completed. The "Century" is very much used in factories, mills, warehouses, abattoirs, stock farms, etc.

The detail of the working parts (shown above) gives a very clear idea of the construction of the pump.

A mechanical agitator keeps the mixture in suspension. Valves are brass balls. They will not clog nor corrode. Pump can be worked at 100 pounds pressure.

Brass cylinder is $2\frac{1}{4}$ inches in diameter, and is always submerged. The long leverage and large air chamber capacity make the "Century" very easy to operate.

The tank is a 50-gallon barrel, and the wheels are broad and strong. The caster at front end facilitates turning. Twenty-five feet of $\frac{3}{8}$ -inch hose, 4-foot extension pipe, and our "Bordeaux" nozzle (the best whitewashing nozzle) are furnished.

*OUTFIT "A" — same as above, but with two 25-ft. sections of $\frac{3}{8}$ -inch hose, each with 4-ft. pipe and "Bordeaux" nozzle.

Deming Adjustable Stroke Single-Acting Power Pump

Fig. 582

Fig. 582, Sizes 5 x 5 and larger

Fig. 582, Size 2 1/2 x 2 to 4 x 4 with Type "B" Drive

Fig. 582 is a single cylinder, outside packed plunger pump with adjustable stroke, and is designed especially for supplying jacket water for cooling gas engines or for other service where pressure does not exceed 50 pounds.

MAIN STANDARD is of cast iron and includes babbitted main shaft bearing and base to which cylinder is bolted. Plunger is outside packed with bolted stuffing box gland.

VALVES are of rubber on bronze grid seats and are quickly accessible.

Type "B" Drive (Cipher, "TYPEB") includes cast iron sub-base, pump gear and rawhide motor pinion for connecting an electric motor, the speed of which should not exceed 900 R. P. M.

Type "C" Drive (Cipher, "TYPEC") includes cast iron sub-base, short belt and spring belt tightener for connecting SLOW SPEED electric motor (not illustrated).

Deming Improved Hand and Power Piston Pump

With Crank Shaft, Pulley and Handle
Will Lift and Force 75 Feet

Fig. 585

This Pump is constructed with cylinder in the stock, the plunger being operated by a steel crank shaft and pitman, which are inclosed below the air chamber. Fig. 585 is well adapted for use in cheese factories and creameries. It is suitable for raising water from shallow wells, springs and cisterns, by hand or power, and will force it to any point desired; or for filling boiler supply tanks, etc.

The cylinder is in a separate casting, and can be renewed when worn.

Fig. 585 will be fitted with stub rod to connect with independent cylinders, for deep wells when specified, at same list price. Cylinders are extra.

Fig. 585, when furnished with tight and loose pulleys for power only, is designated as Fig. 590. See list below.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Improved Power Piston Pump

With Tight and Loose Pulleys
Will Lift and Force 75 Feet

Fig. 591

Fig. 591 is similar in design to our Fig. 590, but is constructed for more severe duty. The crank-shaft extends entirely through the body of the pump, with bearings on both sides, adding greatly to the durability. It is very generally used in creameries, cheese factories, cotton gins, shops and factories, for pumping water from wells for the boiler supply tank. For deep wells we supply it with an independent cylinder of suitable size for the additional cost of the cylinder.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

The Deming Hydraulic Ram, Fig. 690

The Hydraulic Ram in Operation

A DEMING HYDRAULIC RAM installed at a spring means a constant supply of fresh water in the home at practically no operating expense. Below is briefly explained the construction of the Hydraulic Ram; its method of operation; and the conditions under which it may be installed.

It is impossible in a general catalogue like this to give exact specifications of the various conditions under which a Hydraulic Ram will operate successfully. The illustration above will give a general idea of the utility of this wonderful machine in supplying water to a suburban or country residence. IN A SEPARATE BULLETIN, THIS SUBJECT IS MORE FULLY TREATED.

Operation

Deming Hydraulic Rams are used to elevate a part of the water supply to a point higher than the level of supply. The machine in its simple form consists of a body to which is attached an impetus or overflow valve, and an air chamber under which is a check valve. In operation the supply water flows into the ram body through a drive pipe leading from a spring to the ram; the water then passes out through the impetus valve until the column attains sufficient speed to raise the impetus valve to its seat. This stops the column of water in the drive pipe and the pressure produced by stopping this column forces a small quantity through the check valve into the air chamber compressing the air slightly, when the check valve closes and prevents it from returning to the drive pipe. The air, being now at a pressure greater than that due to the head in the discharge line, forces the small quantity into the supply tank.

At the moment the check valve closes, the column of water in the drive pipe rebounds a short distance which removes the pressure from the impetus valve and permits it to open of its own weight. This completes one cycle. These movements continue automatically.

Suggestions for Installing

The LENGTH of the drive or supply pipe should be about five times the FALL. The Hydraulic Ram is MOST EFFICIENT when the VOLUME of the AIR CHAMBER is EQUAL to the VOLUME of the DISCHARGE PIPE.

The upper end of the drive pipe should always be a foot or more below the surface of the water. It should be located six or more inches above the bottom of reservoir and a strainer placed on end of pipe.

Pipes should be laid straight to reduce friction. Where turns are necessary, long bends are better than abrupt angles.

Locate the Ram in a masonry-lined pit, and bolt it on a LEVEL FOUNDATION. Provide drainage for waste water from the bottom of pit. Place all pipes below the frost line.

No two installations are alike; therefore we much prefer to make suggestions and give information covering each individual case.

The Deming Hydraulic Ram, Fig. 690

Tables of Efficiency, Etc.

Ideal Arrangement for Installing Hydraulic Ram where the fall is too great or the Reservoir located considerable distance from the Ram

No. 3

No. 5

No. 8

Three
Popular Sizes
of the Seven
Deming Rams

Information We Should Have

FALL IN FEET vertically from surface of water in the supply reservoir to level of the Hydraulic Ram.

NUMBER OF GALLONS of water per minute supplied to the Ram.

ELEVATION OR HEIGHT in feet (vertically above level of Ram) at which water is to be discharged.

QUANTITY OF WATER per day of 24 hours (in gallons) required to be discharged into storage tank.

LENGTH OF DRIVE PIPE in feet. It should not be less than five times the fall to give best results. It may, however, be longer.

LENGTH IN FEET OF DISCHARGE PIPE.

ESTIMATE OF EFFICIENCY: To find the quantity of water a Deming Ram will deliver, multiply the fall in feet (from spring to Ram) by the number of gallons per minute supplied; divide the product by twice the height to which the water is to be forced; the result will be the quantity per minute discharged.

EXAMPLE OF EFFICIENCY: With a fall of six feet to the Ram from a spring flowing ten gallons per minute, and a height of 40 feet from the Ram to the point of delivery, the estimate is made as follows: $\frac{6 \times 10}{40 \times 2} = \frac{60}{80}$ or $\frac{3}{4}$, being the quantity (in gallons) per minute the Ram should deliver. This condition requires a No. 4 or 5 Ram.

The Deming "Hydraeram"

A Modern Hydraulic Ram

Fig. 695

The apparatus represented by the annexed engraving is our new Automatic Hydraulic Pumping Engine, or Hydraulic Ram, which we designate as Fig. 695 and have given the name of "HYDRAERAM." This name has been registered at the patent office as a trade mark. We have been granted a design patent.

THE HYDRAERAM IS MORE EFFICIENT than other machines of the kind. It is new in design and construction, as may be seen by the illustration. The air chamber, base, and impetus valve chamber are cast integral. The facility with which the Hydraeram may be adapted to various conditions surpasses everything in the line of automatic pumping apparatus. The Hydraeram can be regulated without detaching any of the parts, and under favorable conditions will discharge water to a height of fifteen times the amount of fall.

THE AUTOMATIC AIR SUPPLY is attained by the valve construction, and is so regulated as to give the most efficient results.

IN ORDERING A "HYDRAERAM," care should be exercised in giving us as near as possible the amount of WATER PER MINUTE that can be supplied to the machine; the amount of WATER REQUIRED every twenty-four hours; the NUMBER OF FEET FALL (vertically) that can be obtained from the reservoir to the "Hydraeram," and the length of drive pipe; also the VERTICAL and horizontal DISTANCE the water must be DISCHARGED, i. e., height water is elevated, and length of discharge pipe. DIRECTIONS FOR SETTING AND STARTING FURNISHED WITH EACH MACHINE.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Power Air Compressor or Vacuum Pump

Fig. 680

Fig. 680 Single-Acting Power Air Compressor and Vacuum Pump is well adapted to pumping into receivers for starting gas or gasoline engines, for use in connection with dry pipe sprinkler systems, in garages, chemical works, potteries, hospitals, and by artists and dentists.

This compressor is made in the best manner possible from the best of materials. The crank shaft is of steel, and the bearings are of large dimensions, lined with the best babbitt metal. The piston is of iron, packed with iron spring rings, and the valves are of steel, seating vertically on bronze seats, thereby insuring the least possible wear and minimum clearance. Oil cups are furnished.

The cylinder is thoroughly water jacketed to enable the pump to be operated continuously at the maximum rated speed and pressure. For intermittent service these compressors may be operated at one-third higher speeds and pressures than listed.

Fig. 680 standard construction includes heavy rim belt fly-wheel, as illustrated, but is also furnished with loose pulley at extra price as listed.

Fig. 680 with Type "B" Drive (Cipher, "TYPEB") consists of the standard compressor without pulley, but with sub-base and gearing connection for electric motor.

Fig. 680 with Type "C" Drive (Cipher, "TYPEC") consists of the standard pump with fly-wheel pulley, and with sub-base, short belt and spring belt tightener for connecting electric motor.

Motor is not included with Types "B" and "C" Drives, but can be furnished at extra price.

Fig. 680, Sizes, Capacities, Prices, Etc.

Deming Improved Pumping Jacks

For Operating Pump Standards

Fig. 747

View of No. 1 size, connected to Deming Windmill Pump Standard, Fig. 440.

Pump Stand disconnected from Jack

View of No. 2 size connected to Standard of Fig. 453.

In these jacks the rests bolt securely to platform and serve as a brace to help support the jack and brace the pump stand. The pump connection is designed to make quick change from jack to windmill or hand pumping without removing any bolts. When the pump is set directly under a windmill it can be operated by hand, by windmill or by gasoline engine.

No. 0 is not illustrated, but is in general appearance very much like No. 1, except that it is double geared.

No. 1 is single geared.

No. 2 is double geared, equally dividing the load. Has adjustable foot rest. Shafts are extra heavy.

Typical Deming Rotary Force Pump

Fig. 577 (In Section)

Deming Rotary Force Pumps are adapted for a suction lift of 12 to 15 feet. As a rule they may be used for a total lift and force of 60 feet, depending of course upon the conditions.

Liquids can be drawn horizontally any reasonable distance. In such case, the suction pipe should incline upward a trifle. Deming Rotary Pumps are very easy to install; it being necessary only to attach the required lengths of suction and discharge pipe to the openings in the pump.

As shown in the illustration, the working parts consist of a pair of toothed pinions, which when they revolve, mesh into each other and secure the required suction. The discharge from a rotary pump is uniform and constant. However, they are not adapted to very heavy duties. They are very much used for circulating cooling water for gasoline engines; pumping cider, vinegar, wine, milk, etc.; pumping oil, chemicals, gasoline, kerosene, etc. They are easy to clean and for that reason are often used where food products are handled in liquid form.

If hot liquids are to be pumped, we should be advised, for the reason that vapor arising from a hot liquid will prevent the pump from forming a vacuum. For priming purposes, there is a hole in the top of the pump. There is also a drain plug at the bottom. Wherever aciduous liquids are to be handled, we recommend that bronze pumps be used.

If a small quantity of oil is run through the pump before and after using, it will prevent rusting.

In order that rotary pumps be operated with maximum efficiency, they have to be very accurately made. With our special machinery for manufacturing this type of pump, we are in position to make rotary pumps which will operate to the very best advantage, under the conditions for which they are recommended.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Improved Rotary House Force Pumps

Will Lift and Force 60 Feet

Fig. 578

Fig. 578

The base of this pump is flat and square, with a cast hub projecting below. Both suction and discharge are fitted for hose couplings but will be fitted for iron or lead pipe if so ordered. Fig. 578 has flat fly-wheel and is generally mounted on a table or bench. It is well adapted for pumping cider, vinegar, wine, milk, cream, water or oil.

Fig. 579

Rotary force pump, Fig. 579, is the same type as Fig. 578 except that it is made with a hand crank instead of fly-wheel. It is also provided with brackets for attaching to post or wall. The suction is regularly fitted for iron pipe, but will be arranged for lead pipe or hose, when so ordered, at a slight additional cost. If Fig. 579 is wanted with hand fly-wheel, add \$2.00 to the list price. By removing cap on top of spout and attaching it to end of spout, Fig. 579 is adapted to upward discharge, as also is Fig. 578.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Improved Hand Rotary Force Pump

With Fly-Wheel and Crank
Will Lift and Force 60 Feet

Fig. 575

This is one of our most popular types of hand rotary force pumps and is largely used by brewers, wine producers, distillers, gas companies, etc. Being metallic fitted, it is especially adapted for their requirements.

As is explained at the beginning of this chapter, our rotary pumps are most accurately and carefully manufactured, the cases and cams of each size being made to exact gauges and templets. The peculiar construction of the rotary pump requires the utmost accuracy in fitting every part.

When used for handling acids, the working parts should be made of bronze metal. In such event the pump is made all bronze except the fly-wheel and base, and extra price is charged for which see list below. For pumping oil or fermented and acetous liquids Fig. 575 is very efficient, and for pumping hot or cold water, it can be used in place of an ordinary piston pump.

The fly-wheel is 20 inches in diameter. A 36-inch fly-wheel will be furnished on Nos. 4, 5 and 6 at \$4.50 extra list, when specified. Fig. 575 is regularly fitted for iron pipe.

Deming Improved Hand Rotary Force Pump

With Barrel Attachment
Will Lift and Force 60 Feet

Fig. 576

Fig. 576

Usual method of operating Fig. 576

This is an ideal pump for dealers in oils and liquors. With it, the liquid can be transferred from the cellar to any part of the building. It is a positive suction and force pump — simple in construction and easily operated. It is furnished with top discharge and spout, crank handle and iron suction pipe, the latter being fitted with a barrel attachment which will fit the bung-hole of steel drums when tapped for 1½ or 2-inch pipe. This can also be used for bungholes of wooden barrels by simply screwing it into the wood. By forcing the tapered end into the bung-hole, the pump is held firmly in place. A hook for holding discharge hose on edge of tank is also included. Hose is not furnished regularly with the pump but we can supply it in any lengths at additional cost. List prices include hose couplings.

Fig. 577 with Type "B" Drive

Deming Power Rotary Force Pumps

With Bottom Suction
Will Lift and Force 60 Feet

Figs. 577 and 577½

Fig. 577 Rotary Force Pump is used largely in oil refineries, distilleries, creameries, wine cellars, and wherever water or other liquids must be rapidly elevated by power. It is essential that the liquid being pumped is entirely free from gritty substances, and that the suction lift should not exceed 15 feet.

Fig. 577½ is the same as Fig. 577, except is furnished for upward discharge without spout.

This pump is mounted on heavy cast iron base frame and furnished with tight and loose pulleys, while beyond the pulleys the drive shaft runs in a heavy babitted bearing. Drip cock is provided to prevent freezing. Unless otherwise ordered, leather packed suction valve is provided.

The case which receives the cams is carefully turned and bored, and is perfectly true and smooth, while the cams are accurately machined to the form which years of experience has demonstrated will produce the minimum of friction and wear, and at the same time give the best results in pumping.

For vertical discharge with Fig. 577, the cap shown in the illustration should be placed on the spout and pipe connection made on top.

This pump with Type "B" Drive (Cipher, "TYPEB") consists of the standard pump without pulleys, but with sub-base and gearing connection for electric motor HAVING SPEED OF 1200 REVOLUTIONS PER MINUTE, OR LESS. Unless otherwise specified, the motor pinion is made of rawhide. Motor can be furnished, if desired, at extra price.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Automobile Rotary Gasoline Pump

With Tall Base
Will Lift and Force 60 Feet

Fig. 776

The "Typical Installation" below shows how Fig. 776 may be installed and connected up to underground tank.

The working parts of Fig. 776 consist of a set of cams enclosed in an iron case and mounted on a tall base. To operate, if a cock is on the spout, open the cock and turn the crank in the direction indicated by the arrows on the face of the pump. When through pumping, turn the crank in the opposite direction several revolutions, after which the cock should be closed, thus preventing the escape of gasoline and reducing fire risk to a considerable degree. For the price, no better pump is made.

In this "Typical Installation" the tank is 24 inches in diameter, 36 inches long; has 1-inch suction pipe; $\frac{1}{4}$ -inch air vent pipe and air cock and 2-inch filling pipe.

Typical Installation

The tank should be buried outside the garage. This illustration is shown as a guide to those desiring to install such an outfit. Prices on storage tanks, fittings, etc., will be quoted on application.

Deming Power Rotary Force Pump

Will Lift and Force 100 Feet

Fig. 595

Fig. 595

Fig. 595 with Type "B" Drive

Fig. 595 Rotary Pump is designed to meet the demand for pumps for pumping small quantities of oil or gasoline. It is also recommended for pumping water for house supply or other purposes where power is available, and the liquid is entirely free from gritty substances.

It is simple in construction, consisting of a pair of special machine-cut gears running together in a tight case. It is mounted on a substantial iron base frame with babbitted bearing for shaft. Suction connection at either side, and discharge at the top. Price includes tight pulley only, but loose pulley will be supplied to order.

Fig. 595 with Type "B" Drive (Cipher, "TYPEB") is identical in construction with the Fig. 595, except that it is mounted on a substantial cast iron base with electric motor and connected to the motor by gearing. The motor speed should not exceed 1,800 revolutions per minute for the maximum pump speed of 200. Motor is not included in price, but will be furnished at extra charge.

†When telegraphing with reference to Type "B" Drive, place the cipher word "TYPEB" immediately after the cipher word for the standard belt driven pump.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Special Power Rotary Oil Pump

For Lubricating Machine Tools
Will Lift and Force 60 Feet

Fig. 580

With Pulley

Fig. 580 is a Rotary Force Pump which has been designed to meet the requirements of machine tool manufacturers, for lubricating special screw threading and tapping tools. A bracket is attached to the pump, by means of which it may be bolted to the machine.

This pump may also be used for pumping small quantities of water for house supply where it can be operated by electric motor or other power, such as small gas engine. It is compact and takes up but little space. The pump should not be set more than 10 to 15 feet above the liquid, preferably as near to it as possible.

This little pump can be run with safety as high as 150 revolutions per minute, but 100 is about the proper speed. It is made in bronze only on special order. The diameter of shaft is $\frac{3}{4}$ inch, and the length $2\frac{3}{4}$ inches from stuffing-box to outer end.

A pulley of proper size should be attached to the shaft and the Pump Bracket fastened rigidly to the machine tool if thus used, or to a wall or upright timber if used for water supply as suggested above.

Can be used as either a right or left hand pump.

When fitted with $1\frac{1}{2}$ x 4-inch flanged pulley, add \$2.00 to the list price.

Deming Standard Horizontal Centrifugal Pump

Fig. 598

Fig. 598 Horizontal side suction centrifugal pump is the style most extensively used and, with the exception of the two smaller sizes, is adapted for elevations up to 100 feet, or equivalent pressure. It is designed and constructed throughout on very liberal lines. The case or shell is of the solid type, and the runner is of large diameter, adapting the pump for slow speeds.

The inside of the case is machine-finished and the runner machined and accurately fitted to it. The shaft is large and the bearings, which are self-oiling in sizes No. 1½ and larger are generously proportioned. An ample stuffing-box and gland are provided. All parts are accurately interchangeable, and any part can be readily duplicated.

The pumps are furnished for discharge at any angle desired, and, when so

ordered, any of these pumps can be supplied with the discharge necks increased so that the discharge opening is the same size as the suction opening.

NOTE—The illustration on the opposite page shows Fig. 598 with hand suction primer.

Deming Electric-Driven Horizontal Centrifugal Pump

Fig. 599

Fig. 599 arranged for direct connected motor drive.

The smaller sizes have both pump and motor mounted on a cast iron bed-plate, while the larger sizes are mounted on a steel frame instead.

The pump is provided with a bracket bearing of the ring-oiling type, which is outside of and separate from the stuffing-box.

Flexible couplings, connecting the pump and motor shafts, can be furnished at an extra price when so ordered.

To adapt these pumps to the various motor speeds, special construction is always necessary; therefore, inquiries should always state the voltage and the kind of current used, amount of liquid to be pumped, the length and sizes of piping and the total height to which liquid is to be raised.

SEPARATE BULLETINS

Descriptive of our complete line of triplex power pumps and comprising many different types and sizes, will be sent upon request. However, to give a general idea of the appearance and construction of these pumps, a few representative types are listed in this section of the Catalogue.

Deming Triplex Power Pumps For Operation By Any Power

Installation of Deming Triplex Power Pumps in the plant of the
Eastman Kodak Co., Rochester, New York

Our complete line of triplex power pumps is covered by a number of individual Bulletins. However, to give a general idea of the construction of these pumps, we illustrate in this section a few of the most popular types.

Deming Triplex Power Pumps are for operation by electric motors, gas, gasoline or steam engines, water wheels, etc., either belt driven or direct connected to the driver. They are very much more economical to operate than the direct acting steam pump and will show savings of two-thirds and often more when compared with costs of steam pumping. When electric driven, they can be installed in any convenient place without reference to the location of a central power plant.

Deming Triplex Pumps embody the principle of the three-throw crank shaft, with the crank pins at an angle of 120 degrees with each other, by which arrangement the strokes follow and overlap one another. This results in a continuous and uniform action upon the fluid being pumped, and insures an easy flow through the delivery pipe, with a corresponding high degree of efficiency in the operation of the pump.

They are regularly made with capacities from 300 gallons to 60,000 gallons per hour, and on special orders will be built in much larger sizes. A brief summary of the many different uses for Deming Triplex Pumps is given below:

BELT DRIVEN: For waterworks, boiler feeding, paper and pulp mills, and for all kinds of factory pumping.

ELECTRIC DRIVEN: For waterworks, compression and open tank pumping for private water supply, fire service, boiler feeding, brine circulating, hydraulic elevators, hydraulic pressure accumulators, mine pumping, irrigating, etc.

GAS OR GASOLINE DRIVEN: For waterworks, railway tank service, private water supply, mine pumping, irrigating, etc.

WATER WHEEL DRIVEN: For irrigating and other purposes.

We invite correspondence with reference to special pumping equipment, and will gladly prepare and submit estimates on pumps to satisfactorily meet existing conditions.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Information We Should Have to Furnish an Intelligent Estimate on Deming Triplex Power Pumps

It will greatly facilitate correspondence if our customers, in writing for quotations, will advise us fully of their requirements. In order that we may recommend and quote on the best pump to meet these requirements, IT IS NECESSARY THAT WE KNOW:

FIRST: For what purpose the pump is to be used.

SECOND: The maximum quantity to be pumped per minute, per hour, or per day of twenty-four hours.

THIRD: To what height the liquid is to be lifted by suction, and the diameter and length of the suction pipe.

FOURTH: The height, or pressure, against which liquid is to be discharged, also diameter and length of discharge pipe.

FIFTH: Whether the liquid to be pumped is hot or cold, salt or fresh, acid, clear, thick or gritty.

SIXTH: Power available for driving the pump.

IF THE PUMP IS TO BE DRIVEN BY ELECTRIC MOTOR, WE SHOULD KNOW:

FIRST: Whether the current available is direct or alternating. If direct, state the voltage, and if alternating, state voltage, number of cycles and phase.

SECOND: Whether the pump is to be driven by belt from motor, or to have same direct connected by gearing, or otherwise.

IF THE PUMP IS TO BE DRIVEN BY GAS OR GASOLINE ENGINE, WE SHOULD KNOW:

FIRST: Whether it is to be driven by belt from engine, or direct connected by friction cut-off coupling.

SECOND: If by friction coupling, whether pump and engine are each to be mounted on masonry foundations, or furnished with cast iron bed plate extending under both, also the speed of the engine.

IF PUMP IS TO BE DRIVEN BY STEAM ENGINE, WE SHOULD KNOW:

FIRST: The steam pressure available at the engine.

SECOND: Whether vertical or horizontal engine is wanted.

THIRD: Whether connection is to be made by flanged coupling or by friction coupling.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Single-Acting Triplex Plunger Pump

Fig. 50, for General Service

Fig. 50 Single-Acting Triplex Pump is designed for water works, hydraulic elevator service, boiler feeding, pulp grinders and for general water supply.

Specifications

FRAME consists of two standards, and includes crosshead guides and main crank shaft bearings, the latter being lined with best anti-friction metal. In sizes 4 x 4 and smaller the frame is cast in one piece with the cylinders.

CRANK SHAFT is of best open hearth steel casting in one piece.

GEARING is machine cut, and is double in 9 x 10 and 10 x 10 sizes, and in sizes 11 x 12 and larger. Other sizes made with double gearing at extra price.

PINION SHAFT is of steel, running in boxes lined with best anti-friction metal, and bolted to the main housings.

CONNECTING RODS, in sizes 4 x 6 and larger, have bronze boxes with wedge and screw adjustment at crosshead end, and marine type babbitted boxes at crank end. Smaller sizes have bronze bushings at crosshead ends.

CROSSHEADS run in bored guides, sizes 4 x 6 and larger having adjustable bronze shoes.

PLUNGERS are of hard, close-grained cast iron, finished true and smooth, and reciprocate through packing of ample depth.

CYLINDERS AND BASE are in one casting in sizes 10 x 10 and smaller, and in larger sizes the cylinders are in three separate castings bolted to the base.

VALVE CHAMBERS, in sizes 3½ x 4 and larger, are separate castings bolted to the cylinders. They are of liberal proportions, affording large valve area, and all valves are readily accessible.

VALVES for cold water are rubber discs, protected on top from cylindrically wound springs by brass plates. For hot water, either special hard composition valves or bronze valves are furnished as ordered.

VALVE SEATS are of bronze, screwed into decks, and are of the grid type. Iron seats and valves furnished when conditions require.

AIR CHAMBER furnished when specified. Vacuum Chamber to order.

GREASE CUPS, or Oil Cups if specified, and wrenches furnished with all pumps.

SPECIAL CONSTRUCTION: Pumps furnished with brass cased or solid bronze plungers, and bronze lined stuffing boxes and glands, with rawhide pinions, or otherwise varied from standard construction, at extra price.

For different Types of Drive for pumps direct connected with electric motor, gas engine, or other motive power, see pages 155 to 162, inclusive.

Deming Single-Acting Triplex Plunger Pump

Fig. 50, for General Service

Fig. 50, Sizes $3\frac{1}{2} \times 3$ and smaller

Fig. 50, Sizes 4×6 to 5×6

Fig. 50, Sizes $5\frac{1}{2} \times 8$ to 8×10 with Type "B" Drive

Type "B" Drive (Cipher, TYPEB) consists of intermediate pump gear, rawhide, or fibre, motor pinion, and bedplate under both pump and motor, except in the larger sizes, which have separate motor bedplate bolted to the pump base. Recommended where space for installation is limited and some noise due to high speed gearing is not objectionable.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Single-Acting Triplex Plunger Pump

Fig. 40, for Medium Service

Fig. 40 Single-Acting Triplex Pump is designed for medium heavy service, such as circulating brine, tank supply for factories, railway stations, etc.

Specifications

FRAME consists of two standards, and includes the crosshead guides and main crank shaft bearings, the latter being lined with best anti-friction metal. In sizes $5\frac{1}{2} \times 6$ and smaller the frame is cast in one piece with the cylinders.

CRANK SHAFT is of best open hearth steel casting in one piece.

GEARING is machine cut, and is double in sizes 12×14 and larger.

PINION SHAFT is of steel, running in boxes lined with best anti-friction metal and bolted to main housings.

CONNECTING RODS, in sizes 7×8 and larger, have bronze boxes with wedge and screw adjustment at crosshead ends, and marine type babbitted boxes at the crank ends. Smaller sizes have bronze bushings at crosshead ends.

PLUNGERS are of close-grained gray iron, turned and ground true and smooth, and have crossheads with bronze shoes adjustable for wear.

CYLINDERS and base are in one casting, except in 12-inch stroke sizes which have cylinders in separate castings.

VALVE CHAMBERS in all sizes except $5\frac{1}{2} \times 8$ and 6×8 are in separate castings bolted to cylinders. They have large valve area, and all valves are readily accessible.

VALVES for cold water are rubber discs, protected on top from cylindrically wound springs by brass plates. For hot water, either special composition valves or bronze valves are furnished as ordered.

VALVE SEATS are of bronze, grid type, screwed into the decks. Iron seats and valves furnished when conditions require.

AIR CHAMBER furnished when specified. Vacuum Chamber to order.

GREASE CUPS, or Oil Cups if specified, and wrenches furnished with all pumps.

SPECIAL CONSTRUCTION: Pumps furnished with brass cased or solid bronze plungers, and bronze lined stuffing boxes and glands, with rawhide pinions, or otherwise varied from standard construction, at extra price.

For different Types of Drive for pumps in connection with electric motor, or other motive power, see pages 155 to 162, inclusive.

Deming Single-Acting Triplex Plunger Pump

Fig. 40, for Medium Service

Fig. 40. Sizes 4 x 6 to 5½ x 6

Fig. 40. Sizes 5½ x 8 and 6 x 8

Fig. 40. Sizes 7 x 8 to 9 x 10 with Type "B" Drive

Type "B" Drive (Cipher, TYPEB) consists of intermediate pump gear, rawhide, or fibre, motor pinion, and bedplate under both pump and motor, except in the larger sizes, which have separate motor bedplate bolted to the pump base. Recommended where space for installation is limited and some noise due to high speed gearing is not objectionable.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Single-Acting Triplex Plunger Pump

Fig. 52, for Heavy Duty

Fig. 52 Single-Acting Triplex Pump is designed for working pressures of from 200 to 400 pounds, or equivalent elevations. It is especially adapted for general water supply, boiler feeding, hydraulic elevators and mine pumping, where the pressures do not exceed the ratings given below.

FRAME consists of two standards, and includes crosshead guides and main crank shaft bearings, the latter being lined with best anti-friction metal.

CRANK SHAFT is of best open hearth steel casting in one piece.

GEARING is machine cut, and is double in size 6 x 8 for 300 pounds pressure and larger sizes; smaller sizes made with double gearing at extra price.

PINION SHAFT is of steel, running in boxes lined with best anti-friction metal and bolted to main housings.

CONNECTING RODS have bronze boxes with wedge and screw adjustment at the crosshead end, and marine type babbitted boxes at the crank end.

CROSSHEADS run in bored guides, and have bronze shoes adjustable for wear.

PLUNGERS are of hard close-grained cast iron, finished true and smooth, and reciprocate through deep stuffing boxes.

CYLINDERS and base are in one casting in sizes 8 x 10 and smaller, and in larger sizes are in three separate castings bolted to the base.

VALVE CHAMBERS are separate from and bolted to the cylinders. They are of liberal proportion, affording large valve area, and all valves are readily accessible.

VALVES for 300 pounds pressure or less are of special composition rubber with bronze seats of the grid type, unless specified otherwise. For higher pressure, valves are of bronze.

AIR CHAMBER supplied with pumps. Vacuum Chamber to order.

GREASE CUPS, or Oil Cups if specified, and wrenches furnished with pump.

SPECIAL CONSTRUCTION: Solid bronze plungers, bronze lined stuffing boxes and glands rawhide pinions, or other variations from standard construction, at extra price.

For different Types of Drive for pumps direct connected with electric motor, gas engine, or other motive power, see pages 155 to 162, inclusive.

Deming Single-Acting Triplex Plunger Pump

Fig. 48

Especially designed for pumping into open or compression tanks in apartment houses, residences, office buildings, or wherever quietness of operation is essential. These pumps have unusually large valve area, which permits operating at much higher speeds than is the usual practice with geared pumps, resulting in much greater capacity for the space occupied.

FRAME consists of three standards, which include the crosshead guides and the main crank shaft bearings, the latter being lined with best anti-friction metal.

CRANK SHAFT is of best open hearth steel in one piece, and extended to receive driving pulley.

CONNECTING RODS, in sizes 4 x 6 and larger, have bronze boxes with wedge and screw adjustment at the crosshead ends, and marine type babbitted boxes at the crank end. Smaller sizes have bronze bushings at crosshead end.

CROSSHEADS run in bored guides, and sizes 4 x 6 and larger have bronze shoes adjustable for wear.

PLUNGERS are of close grained cast iron, finished true and smooth, and reciprocate through packing of ample depth.

CYLINDERS in sizes 5 x 6 and smaller are integral with the main guide frame.

VALVE CHAMBERS in sizes 3½ x 4 and larger are separate castings bolted to the cylinders. All valves are readily accessible.

VALVES for cold water are rubber discs protected on top from cylindrically wound springs by brass plates. Bronze or hard rubber valves furnished for hot water when specified.

VALVE SEATS are of bronze, and in sizes 2 x 2 and larger are of grid type, screwed into the decks.

GREASE CUPS, or Oil Cups if preferred, and wrenches furnished with all pumps, also air chamber if specified. Vacuum Chamber to order at extra price.

SPECIALS: Pumps furnished with brass cased plungers, or solid bronze plungers, and bronze lined stuffing boxes and glands at extra price.

For different Types of Drive for Fig. 48 pumps in connection with electric motor and gas engine, see opposite page.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Single-Acting Triplex Plunger Pump

Fig. 48

Fig. 48. Sizes 2 x 2 to 3 1/2 x 3

Fig 48. Sizes 3 1/2 x 4 to 5 x 6

Fig. 48. Sizes 2 x 2 to 3 1/2 x 3 with Type "C" Drive

Fig. 48. Sizes 2 x 2 to 3 1/2 x 3, with Type "B" Drive

Type "C" Drive (Cipher, TYPEC) includes cast-iron bedplate under pump and motor, with connection by short belt and spring belt tightener. Very desirable outfit where limited space is available for installation and quietness in operation is essential.

Type "B" Drive (Cipher, TYPEB) includes cast-iron bedplate on which both pump and motor are mounted with connection by gear and rawhide, or fibre, motor pinion. Recommended where space for installation is limited and some noise due to gearing is not objectionable.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Types "C" and "D" Drives for Deming Geared Power Pumps

Fig. 50, Sizes 2 x 2 to 3½ x 3 with Type "C" Drive

Fig. 40, Sizes 4 x 6 to 5½ x 6 with Type "D" Drive

Type "C" Drive (Cipher, TYPEC) consists of bedplate under pump and motor, with connection by short belt and spring belt tightener. Recommended where limited space is available and quiet running is essential. With rawhide pump pinion, practically all noise is eliminated.

Type "D" Drive (Cipher, TYPED) consists of bedplate under pump and motor in smaller sizes, and motor bed plate bolted to pump bed plate in larger sizes, with motor connected to pump by silent chain drive. More quiet in operation than the geared drive and occupies small space.

Type "K" Drive for Deming Geared Power Pumps

Fig. 50, Size 5½ x 8 with Type "K" Drive

Type "K" Drive (Cipher, TYPEK) furnished with friction cut-off coupling for direct connecting to gas engine on masonry or other foundations. No bedplate furnished.

HORIZONTAL DOUBLE-ACTING POWER PUMPS

FOR

VARIOUS DUTIES

DOUBLE-ACTING POWER PUMPS
OPERATED FROM ANY POWER
SOURCE FOR MINE PUMPING,
CONTRACTORS' USE, WATER
TANK SERVICE IN FACTORIES
AND MILLS, PNEUMATIC TANK
SERVICE, ETC.

SEPARATE BULLETINS

Descriptive of our complete line of horizontal power pumps and comprising many different types and sizes, will be sent upon request. However, to give a general idea of the appearance and construction of these pumps, a few representative types are listed in this section of the Catalogue.

Deming "Atlas" Double-Acting Power Piston Pump

Fig. 691

For Hydro-Pneumatic Water Systems and
General Water Supply

Especially Adapted to Hydro-Pneumatic Service

The "Atlas" Pump is regularly fitted with an air-charging device for supplying air to pneumatic tank for hydro-pneumatic water supply. If the pump is to be placed lower than the source of supply, we recommend that it be fitted with air compressor (see illustration at bottom of opposite page); but if water supply is located at a lower level than the pump, the regular air-charging device will be entirely satisfactory.

Suited for Long Distance Pumping

The "Atlas" Pump is DOUBLE-ACTING and discharges water at each stroke of the pump. It will lift water vertically by suction, a distance of 25 feet or less.

It will draw water horizontally from 200 to 300 feet; will force it vertically 150 feet; and will also force water horizontally for two or three miles, provided the discharge pipe is large enough to prevent excessive friction. With a 1¼-inch discharge pipe the "Atlas" Pump can usually be depended upon to force water horizontally for approximately one mile. However, for hydro-pneumatic service, the pump should be placed as near the tank as possible. The "Atlas" is built for 75 pounds maximum pressure.

Smallest Size Easy to Operate With Hand Attachment

The "Atlas" may be operated by gasoline engine or electric motor. The 2¼ x 5-inch size will be fitted with hand attachment when specified. This is often done as a precaution against failure of engine or motor. When operated by hand the "Atlas" works no harder than the ordinary hand tank pump.

Suction and Discharge Valves Easy to Reach

Each of the two valve chambers contains one set of discharge and suction valves. To gain access to these valves, remove the three cap screws from each of the valve chamber covers. The opening thus made is plenty large enough to admit inserting the hand for withdrawal of one set of the discharge valves. A set of suction valves is located directly under the discharge valves in each valve chamber. These suction valves may be withdrawn through the same opening as the discharge valves.

Other Points of Advantage

Cylinder is brass lined. On the two larger sizes the liner may be easily removed. All bearings are babbitted, insuring long life and minimum friction. Gears are fully enclosed by cast iron gear guard. Cylinder and valve decks are cast in one piece. They cannot pull apart.

Crank end of connecting rod has adjustable boxes which permits taking up of all wear. Valves are metal, faced with rubber, and have BRASS VALVE SEATS. Oil pockets and grease cups insure thorough lubrication.

The "Atlas" is made in three sizes, 2¼ x 5, 3 x 6, and 4 x 8, with capacities of 600, 1200 and 2400 gallons per hour respectively. "Atlas" Pumps are painted "Quaker Gray" and trimmed in gold.

Shipping weights are as follows: 2¼ x 5—140 lbs. 3 x 6—275 lbs. 4 x 8—350 lbs.

For Types of Drives, Capacities, Sizes, Prices, Etc., of Fig. 691, see Pages 170 and 171.

Deming "Atlas" Double-Acting Power Pump

For Wells and Cisterns 25 Feet Deep or Less

Fig. 691

(Continued from two preceding pages)

A few of the reasons for the popularity of the "Atlas" pump are mentioned on page 164.

Further specifications, also list prices, descriptions and illustrations of various types of drives, will be found on this and the opposite page.

Complete hydro-pneumatic systems in which the "Atlas" pump is used are illustrated and described on pages 192 and 193.

A SPECIAL AIR COMPRESSOR will be supplied (see illustration at bottom of page 165) when desired, at extra price, as listed below.

Type "B" Drive (Cipher, "TYPEB"). Includes cast iron sub-base, intermediate gear and rawhide pinion for connecting electric motor.

Type "C" Drive (Cipher, "TYPEC"). Same as Type "CI" Drive with addition of cast iron sub-base under pump and motor. Belt is included. Motor furnished at extra price.

Type "CI" Drive (Cipher, "TYPECI"). Includes tight pulley, 20 inches diameter or smaller, with belt tightener of gravity type for driving by electric motor or gas engine with short belt pulley centers. Larger diameter pulley supplied at extra price. Belt is not included.

Type "G" Drive (Cipher, "TYPEG"). Includes a horizontal or vertical water-cooled, or a vertical air-cooled, gasoline engine mounted on a cast iron sub-base with pump and connected by gearing. See below for prices of outfits with different styles of engines.

HAND OPERATION: Size 2½ x 5 is furnished, when desired, with lever, link and attachments as illustrated, for operating by hand in case of emergency. (Cipher, "HANDOP.")

Deming Double-Acting Power Pump With Attachment for Pumping Air Fig. 708

Fig. 708 is a double-acting power pump, made in three sizes, and good for pumping against pressures up to 200 pounds, which makes it an admirable pump for contractor's service and hydro-pneumatic water supply systems.

It is adapted for a suction lift of 24 feet or less.

Any available power may be used to drive the pump, such as gasoline engine, electric motor, etc. Air chamber has ample capacity.

There are no air pockets in this pump so it cannot become "air bound."

CYLINDER is reversible, so suction and discharge pipes may be arranged for either side.

CYLINDER LINER: Brass and removable.

PISTON PACKING: Special fibrous cup packing.

SUCTION VALVE DECK is removable, to give access to suction valves.

GEARS: Ratio 5 to 1. Machine-cut from the solid; not cast teeth.

PULLEYS: See list below.

VALVES: Brass balls; are accessible without interference with the piping.

VALVE SEATS are cast bronze, and removable.

PISTON ROD: Cannot buckle or get out of line as it is double rod guided.

Type "B" is used to indicate direct connected motor drive.

Type "CI" Drive: Includes tight pulley, as follows: No. 1, 8 x 4; No. 2, 16 x 4; No. 3, 16 x 4. With belt tightener of the gravity type. Pulleys of different diameters furnished at extra price.

*In telegraphing, if motor drive is wanted, add "TYPEB" to cipher word. If "CI" drive is desired, add "TYPECI" to cipher word.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Horizontal Double-Acting Piston Pump

For Heavy Duty

Fig. 1696

FIG. 1696 is especially recommended for pumping oils and other liquids where a pump for high pressure is required.

MAIN FRAME is of heavy box type, and includes bored crosshead guide and babbitt-lined shaft bearings.

CYLINDER is of cast iron fitted with spring ring piston.

CRANK SHAFT is of best open hearth steel casting, accurately machined.

GEARING is machine-cut from the solid and entirely enclosed in substantial gear guard.

CONNECTING ROD has babbitt-lined adjustable bearing at the crank end and bronze bushing at the crosshead end.

CROSSHEAD reciprocates through a bored guide and has shoes adjustable for wear.

PISTON is of cast iron with spring ring packing.

PISTON ROD is of steel working through deep stuffing box with bolted gland.

VALVES are bronze balls on bronze seats screwed into the decks and are easily accessible.

STANDARD CONSTRUCTION includes tight and loose pulleys, grease cups and companion pipe flanges of sizes listed.

Type "B" Drive (Cipher, TYPEB) for connecting to an electric motor, includes a substantial cast-iron sub-base under pump and motor, with an intermediate gear and rawhide motor pinion for connecting motor to pump. See illustration of Fig. 716 Type "B" Drive, page 173.

Sizes, Prices, Etc.

PISTON		Capacity per Revol's Gallons	Revol's per Minute	Capacity per Min. at Max. Speed Gallons	Max. Working Pressure Pounds	DIAMETER OF PIPES		Gear Ratio	Tight and Loose Pulleys Inches	*Cipher

*When telegraphing with reference to Type "B" Drive, place cipher word "TYPEB" immediately following cipher word for the standard belt-driven pump.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming "Triumph" Double-Acting Piston Pump

Fig. 609, for Medium Service

Fig. 609 "TRIUMPH" Piston Pump has been on the market for many years, and has gained great popularity as a gathering pump in mines where a pump of but small capacity is required. It is also well adapted to use in circulating brine, tank supply and boiler feeding where pressures do not exceed the ratings below.

The pump cylinder is securely bolted to a substantial bed plate, and the crank shaft, rod guide, yoke and pitman are so arranged as to keep all parts in perfect alignment. All standard pumps have piston with hydraulic cup packing, tight and loose pulleys, cut gearing and babbitted bearings. The piston rod, stuffing box, valves and valve seats are made of brass, and cylinders are brass lined except in "bronze cylinder" and "all bronze" pumps.

Modification of standard construction to suit special requirements can be made at extra price.

Fig. 609 with Type "B" Drive (Cipher, "TYPEB") is the standard pump without pulleys, but with sub-base and gearing connection for electric motor, as illustrated on opposite page.

NOTE. Fig. 609 can also be furnished mounted on portable truck with motor.

Fig. 609, Sizes, Capacities, Etc.

5	4½	FATEFUL	200.00	FATTY	330.00	FATLY	390.00	115.00

*Pumps with "Brass Cylinder and Piston" also have brass cylinder and valve decks, while "All Brass" pumps have all parts which come in contact with the water made of brass.

†When telegraphing with reference to Type "B" Drive, place cipher word "TYPEB" immediately following the cipher word for the standard pump.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming "Triumph" Double-Acting Piston Pump

Fig. 609, for Medium Service

Fig. 609. All Sizes

Fig. 609 with Type "B" Drive

Deming "Ajax" Double-Acting Piston Pump

Fig. 716, for Medium Service

Fig. 716 is especially recommended as a gathering pump and for other use in mines where the maximum discharge pressure does not exceed that for which it is rated. It is also a very desirable pump for brine circulation and for tank supply for factories, railway water stations, etc.

MAIN FRAME is of heavy box type, and includes bored crosshead guide and babbitt-lined shaft bearings.

CYLINDER is of cast iron with cast bronze liner, and contains the valves which are readily accessible without disturbing pipe connections.

CRANK SHAFT is of best open hearth annealed steel casting, accurately machined.

GEARING is machine cut from the solid.

CONNECTING ROD has babbitt-lined adjustable bearing at the crank end, and bronze bushing at the crosshead end.

CROSSHEAD reciprocates through a bored guide, and has shoes adjustable for wear.

PISTON is fibrous packed.

PISTON ROD is of bronze working through deep stuffing box, with bolted gland.

VALVES are of rubber, on bronze grid seats, which are screwed into the decks.

STANDARD CONSTRUCTION includes tight and loose pulleys, grease cups, wrenches and companion pipe flanges of sizes listed. Modifications of standard construction furnished at extra price.

TYPE "B" DRIVE (Cipher, "TYPEB") for connecting an electric motor includes a substantial cast iron sub-base under pump and motor, with an intermediate gear and rawhide pinion for connecting motor to the pump as illustrated.

NOTE. The 5 and 6-inch stroke pumps can also be furnished mounted on portable truck with motor.

TYPE "BA" DRIVE (Cipher, "TYPEBA") includes an intermediate gear and rawhide pinion for connecting an electric motor, the main frame being altered on top to permit mounting the motor thereon. This drive is only furnished with 10-inch stroke sizes and only for motors having frames of comparatively small dimensions.

Deming "Ajax" Double-Acting Piston Pump

Fig. 716. with Types "B" and "BA" Drives

Fig. 716 with Type "B" Drive

Fig. 716 with Type "BA" Drive

Deming "Neptune" Double-Acting Piston Pump Fig. 696, for Medium Service

Fig. 696, All Sizes

Fig. 696 differs from our other types of horizontal piston pumps in that all valves are quickly accessible from the top by loosening two nuts. This is especially desirable in handling mine water where small particles of coal or other foreign substances are liable to clog the valves. This pump is also well suited for brine pumping and general water supply where pressure does not exceed 75 pounds.

MAIN FRAME is of heavy box type, and includes bored crosshead guide and babbitt-lined shaft bearings.

CYLINDER is of cast iron with cast bronze liner, and contains all valves.

CRANK SHAFT is of best open hearth annealed steel casting, accurately machined.

GEARING is machine cut from the solid.

CONNECTING ROD has babbitt-lined, divided bearing at the crank end and bronze bushing at the crosshead end.

CROSSHEAD reciprocates through a bored guide, and has shoes adjustable for wear.

PISTON is fibrous packed.

PISTON ROD is of bronze working through deep stuffing box, with bolted gland.

VALVES are of rubber, on bronze grid seats, which are screwed into the decks.

STANDARD CONSTRUCTION includes tight and loose pulleys, grease cups, wrenches and companion pipe flanges of sizes listed. Modifications of standard construction furnished at extra price.

Types "B" and "BA" Drives

Fig. 696 is furnished with Type "B" Drive in all sizes the same as Fig. 716, and with Type "BA" Drive in size 6 x 10 only. See illustration and description on pages 172 and 173.

NOTE. The 5 and 6-inch stroke pumps can be furnished on portable truck with motor.

Fig. 696, Sizes, Capacities, Etc.

PISTONS		Cap. per Rev. Inches	Revol's per Minute	Capacity per Min. at Maxi- mum Speed Gallons	Maximum Working Pressure Pounds	DIAM. OF PIPES			Tight and Loose Pulleys	Height with Type "B" Drive Inches	*Cipher

DEEP WELL WORKING HEADS

FOR

SPECIAL WATER SUPPLY

EMBRACING VARIOUS TYPES OF
POWER WORKING HEADS FOR
USE WITH DEMING BRASS ARTE-
SIAN WELL AND OTHER TYPES
OF CYLINDERS; ADAPTED FOR
OPERATION BY ELECTRIC
MOTOR, GAS, OR GASOLINE EN-
GINE, STEAM ENGINE AND
WINDMILL; USING BELT, GEAR-
ING OR CONNECTING ROD.

SEPARATE BULLETTINS

Descriptive of our complete line of working heads and comprising many different types and sizes, will be sent upon request. However, to give a general idea of the appearance and construction of these pumps, a few representative types are listed in this section of the Catalogue.

Deep Well Pumping

Information Desired to Enable Us to Intelligently
Recommend the Best Style of
Deep Well Pump

- "A" Inside diameter of well casing inches.
- "B" Total depth of well feet.
- "C" Depth well is cased feet.
- "D" Depth to surface of water feet.
- "E" Inside diameter of discharge pipe inches.
- "F" Length of discharge pipe feet.
- "G" Discharge head . . feet (or discharge pressure . . pounds per square inch).

Does water level recede when well is pumped, and how much?

What capacity in gallons per minute is wanted at discharge?

What power is available to operate pump?

If electric power is available, and price on electric motor is wanted, state whether current is direct or alternating, and if alternating, state phase and cycles.

Suggestions Concerning the Installation of Deep Well Pumps

The cylinder should be placed at such depth as to insure its being constantly submerged, and unless tests show that the water level does not recede materially it is advisable to place the cylinder near the bottom of the well.

In placing the cylinder in the well special care should be taken to make all pipe and sucker rod joints tight.

For convenience in shipping, cylinders are usually sent with the plunger and lower valve screwed together, and these must be disconnected before lowering the cylinder in the well.

We are not liable for damage done or trouble caused by sand, gravel, chips or any substance other than clear water. The well is supposed to have a straight clear bore of the size specified so that the pump parts will go into it when reasonable clearance is allowed, and also to furnish sufficient clear water to supply the pump.

Deming Deep Well Pump Heads

With Double Rod Guides and Power Attachment
For Wells 35 to 300 Feet Deep

Fig. 439

Fig. 1439

These pump heads have crossheads with babbitted bearings working on double heavy steel rod guides. The stuffing-box gland is of brass. The power attachment is hinged to the crosshead and is designed to fit wood rod of windmill, although it can be altered for other style connection when desired.

Fig. 439 has flanged base to bolt to platform or foundation, and the base is threaded for pipe that connects with cylinder. When so ordered, a separate flange threaded for drop pipe, will be furnished at additional cost.

Fig. 1439 is exactly the same as Fig. 439, but with the addition of a large flanged air chamber.

For use with Figs. 439 and 1439 pump heads, we recommend our Figs. 311 and 324 artesian well cylinders, listed elsewhere and connecting with pipe of larger diameter than the cylinder, which will permit the withdrawal of the plunger and valve by the removal of the stuffing-box flange.

Plunger rods are regularly threaded on lower end, $\frac{3}{4}$ -inch U. S. Standard, but will be threaded otherwise if so specified. In ordering always specify size of suction and discharge pipe wanted.

Sizes and Prices

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Geared Deep Well Working Head

Fig. 569

Fig. 569

Fig. 569 illustrates our Pump Standard for wells of medium depth. It has adjustable stroke (6, 8 and 10-inch) and is furnished with machine cut gearing having a ratio of three to one, and with tight and loose pulleys for operating by power. Fly wheel pulley 36 inches diameter can be furnished, if desired, in place of the tight and loose pulleys.

The illustration shows the No. 2 Pump with air chamber by which water can be forced upward through the top of the air chamber, or through the spout.

In connection with this standard we recommend the use of our Fig. 311 cylinders, or any other type of brass, brass lined or iron deep well cylinder.

In corresponding, give as fully as possible the particulars asked for on page 176, and if working head only is wanted, specify sizes of drop pipe and discharge pipe and also threads on sucker rod.

Fig. 569, Sizes, Prices, Etc.

No.	Stroke Inches	*Suction Fitted for Pipe Inches	Discharge	Gear Ratio	Tight and Loose Pulleys

Deming Geared Deep Well Power Working Head

For Wells 375 Feet Deep or Less

Fig. 66

Fig. 66, with Tight and Loose Pulleys and Air Compressor which working head and electric motor are mounted, with motor direct-connected by gearing. TYPE "CS" DRIVE (Cipher, TYPECS) consists of a cast-iron shelf hinged to the back of working head frame, the motor being mounted on the shelf and belted to the working head. Quieter in operation than Type "B" Drive.

On page 194 this head is shown in connection with a complete hydro-pneumatic water supply system.

This head is adapted especially for pumping water from deep wells for suburban homes and other places requiring a moderate water supply. All parts are readily accessible.

The sucker rod and cylinder valves can be withdrawn without disturbing any pipe connections.

The standard head includes cut gearing, tight and loose pulleys and oil cups. For hydro-pneumatic service an air compressor will be supplied at extra cost. When desired, an extended walking beam and counterweight, for equalizing the plunger load, will be furnished at extra cost as listed below.

Our Figs. 311 or 324 cylinders are recommended for use with this head.

TYPE "B" DRIVE (Cipher, TYPEB) consists of a cast-iron bedplate, on

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Deep Well Power Working Head

Fig. 62, with Differential Plunger

Fig. 62 is adapted especially for supplying water from deep wells for private estates, manufacturing plants, farms, etc. It is very substantially built, and the "low-down" design, as well as other features, make it the most accessible deep well pump on the market. By disconnecting the differential plunger from the crosshead and the walking beam from the connecting rod, and removing the stuffing box cap, the plunger can be readily withdrawn without disturbing the pipe connections. The stroke is adjustable, thereby permitting the easy regulation of the pump capacity to the flow of the water in the well.

The main base is of cast iron, and carries the crank and pinion shaft bearings, which are lined with best babbitt metal.

The gearing is machine cut, the main gear being bolted to a flange integral with the crank shaft.

The crosshead is babbitt lined, and the guide rods are of polished steel.

Each pump has a differential plunger which discharges part of the water on the down stroke, thus equalizing the load and giving a more uniform flow of water. The stuffing box is very easy of access for repacking, the gland being of the bolted type. Air chamber furnished at extra price.

Fig. 62 with Type "B" Drive (Cipher, TYPEB) is the standard pump without pulleys, but with extended base and gearing connection for electric motor.

Fig. 62 with Type "C" Drive (Cipher, TYPEC) is the standard pump mounted on sub-base for connection to electric motor, and including short belt and belt tightener. Adaptable to 10-inch stroke size only.

On page 196, Fig. 62 is illustrated in connection with hydro-pneumatic System No. 2018.

With these working heads we recommend using our Fig. 324 or Fig. 311 artesian well cylinders and Fig. 636 octagon wood sucker rod.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Deep Well Power Working Head

Fig. 61 with Differential Plunger

Fig. 61 Deep Well Working Head is of very rigid construction throughout, and its "low down" design, together with other features, make it one of the most desirable deep well pumps on the market for the work for which it is adapted. Access to the well for repairing cylinder or rod is quickly and easily made. The stroke is adjustable, permitting the regulation of the pump capacity to the supply of water in the well.

MAIN FRAME is of cast iron of very heavy design, and contains both the crank and pinion shaft bearings which are lined with best anti-friction metal.

GEARING is machine cut, the crank gear being bolted to a large flange integral with the crank shaft and located between the main bearings, thereby eliminating torsional strains.

CRANK SHAFT, Connecting Rod, Link and Walking Beam are all of steel.

CROSSHEAD is babbitt lined with provision for lubrication, and the guide rods are of polished steel held in rigid alignment by stay rods extending to the main standard.

DISCHARGE HEAD is located above the base and can be readily turned to discharge to the front as illustrated, or to the right or left as desired.

DIFFERENTIAL PLUNGER works through an outside packed stuffing box with bolted gland.

FIG. 61 WITH TYPE "B" DRIVE (Cipher, TYPEB) is furnished with extended cast iron bed plate and gearing connection for electric motor. Motor can be furnished at extra charge.

FIG. 61 WITH TYPE "K" DRIVE (Cipher TYPEK) is furnished with friction cut-off coupling for direct connecting with gas or gasoline engine when speed of engine is not too great to permit this drive. When engine speed exceeds 200 R. P. M., provision is made for a double reduction of gearing and an extra bearing for a secondary shaft to which a higher speed engine can be connected by friction coupling. Prices for Type "K" Drive are quoted on application with statement of engine horse power and speed.

In connection with Fig. 61 working head we recommend using our Fig. 324 Artesian Well Cylinder and Fig. 636 octagon wood sucker rod.

In corresponding, give as fully as possible conditions under which working head is to be operated, and if working head only is required, specify size of cylinder in use and also threads on sucker rod. See page 176.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Deep Well Power Working Heads

Figs. 80 and 82, with Differential Plunger

Figs. 80 and 82 Deep Well Working Heads are designed for the operation of deep well cylinders, and have incorporated such desirable features as our extensive experience in this line of pumping machinery indicates as the best.

Fig. 82 differs from Fig. 80 (illustrated on opposite page) in having double crank gears, and outboard bearing and stand.

BEARINGS are lined with best anti-friction metal, the pinion shaft bearings being bolted to the main housings.

GEARING is machine cut, the main gear (or gears) being bolted to a large flange (or flanges) integral with the crank shaft.

CONNECTING ROD is of steel with marine type box at the crank end, and bronze bushing at the crosshead end.

CROSSHEAD has bronze shoe adjustable for wear, and runs in polished guides.

DIFFERENTIAL PLUNGER is furnished and equalizes the flow of water, with consequent greater economy and ease of operation.

AIR CHAMBER is supplied; also Grease Cups, or Oil Cups if preferred, and wrenches furnished with all pumps.

Discharge can be connected at either front or back of pump.

When electric motor or steam engine is to be direct connected, we can furnish these working heads with the different Types of Drive as described below and illustrated on pages 90 and 91.

Type "B" Drive (Cipher, TYPEB) consists of connecting an electric motor by an intermediate gear and rawhide, or other quiet running pinion, the pump being provided with a heavy cast iron shelf at the back, on which shelf the motor is mounted.

Motor for Type "B" Drive can be furnished, if wanted, at extra charge.

Fig. 324 Single-Acting Cylinders with Fig. 636 Wood Sucker-Rod, with extra strong pipe sucker-rod, are recommended for use with Figs. 80 and 82.

In corresponding, give the information asked for on page 176, and if working head only is wanted, specify sizes of drop pipe and discharge pipe and also threads on sucker rod.

Figs. 80 and 82, Sizes, Etc.

Deming Single-Acting Triplex Piston Pump

For Deep Open Wells

Fig. 710

Fig. 710 is designed for use in deep open wells where the water is too low to be reached by suction from the surface. The power end is mounted on "I" beams or other supports at the surface and the cylinders are secured to the supports in the well, within suction distance of the water.

When depth of well requires, the well rods should be guided by Fig. 389 double roller guides. See list below.

Air chamber and discharge check valve; grease cups or oil cups, and wrenches, are included in the regular equipment.

DEMING HYDRO-PNEUMATIC WATER SYSTEMS

INCLUDING PUMP
AND
COMPLETE EQUIPMENT

FOR SUPPLYING WATER TO
FARM HOMES, SUBURBAN RESI-
DENCES, COUNTRY CLUBS, SUM-
MER HOMES, GREENHOUSES,
ETC., THE TANK PRESSURE IN
MANY CASES BEING AUTOMATI-
CALLY CONTROLLED, AND THE
PUMP OPERATED BY ELECTRIC
MOTOR, GASOLINE ENGINE
OR BY HAND

A SEPARATE CATALOGUE

Of our complete line of hydro-pneumatic water systems, comprising many different types and sizes, will be sent upon request. However, to give a general idea of the appearance and construction of these systems, a few representative types are listed in this section of the Catalogue.

Deming Water Supply Systems

A representative group of "Deming equipped" homes. Conclusive proof of the adaptability of Deming Systems of water supply to the needs of the modest house or the most elaborate establishment.

No matter how small or how large the home, building or institution may be, there is a Deming system to exactly fit the requirements.

Many thousands of Deming Water Systems are today giving dependable, satisfactory service, covering a range of conditions that is almost without limit. In the tiny bungalow, and in the magnificent country homes of some of the world's richest men, Deming systems are daily proving to the owners the wisdom of their choice.

In the smallest Deming system, the pump has a capacity of 180 gallons per hour with a tank of 53 gallons capacity. The pump in the largest system will deliver 60,000 gallons per hour with a tank capacity 20,000 gallons. In very large installations several tanks are often used.

Each Installation Is Handled As a Separate Proposition

To secure the best results from any water supply system, it is necessary that each outfit be planned to suit the particular conditions under which it must give service. The size of pump, tank and power unit should be based upon the conditions actually prevailing in every case. Upon receipt of a statement of conditions we will be glad to have our experts tell you just which outfit will best do your work. This service is given absolutely without charge and is distinctly understood to place the prospective customer under no obligation whatever.

Note Carefully

WHEN QUOTING ON DEMING OUTFITS, THE SUCKER ROD, PIPE AND PIPE FITTINGS, SUCH AS ELLS, TEES, UNIONS, ETC., ARE NOT INCLUDED, UNLESS SO SPECIFIED, SINCE EACH INSTALLATION IS, AS A RULE, DIFFERENTLY SITUATED AND REQUIRES, THEREFORE, DIFFERENT FITTINGS AND VARYING LENGTHS OF PIPE.

Hand-holes and man-holes in tank ARE FURNISHED ONLY WHEN SPECIFIED, but we recommend that a hand-hole at least be included. For prices see page on which tanks are listed. The water capacity of a tank is approximately two-thirds the total capacity.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming "Climax" Water System No. 2001

For Wells and Cisterns 25 Feet Deep or Less

With the "Climax" System, sufficient water may be stored at one pumping to last a family of four or five about one day for ordinary requirements. The pump can be easily operated against a pressure of 40 pounds in the tank. The pump is provided with air valve so that air and water can be forced into the tank at the same time. If water only is desired, the air valve on the cylinder head can be closed. We recommend that a foot-valve be placed on the end of the suction pipe. Should the supply be higher than the pump, we recommend the use of Fig. 606, described on page 28, instead of the Fig. 608½ pump, listed below.

Equipment Specifications of System No. 2001

One 30-in. x 6-ft. vertical tank.

One Fig. 608½ "Climax" double-acting pump with brass-lined cylinder.

One Fig. 904 1-in. check valve.

One Fig. 900 1-in. globe valve.

One Fig. 913 ¾-in. stop and waste valve.

One Fig. 688 pressure gauge.

One Fig. 917 ½-in. hose bibb.

One glass water gauge.

HAND AND POWER PUMPS FOR ALL USES

Deming "Marvel" Electric House Pumping Outfit For Wells and Cisterns 25 Feet Deep or Less System No. 2085

The "Marvel" system is intended for supplying the requirements of bathroom, laundry and kitchen, in farm and suburban homes, summer cottages and other places where a moderate quantity of water is used.

System No. 2085 is self-starting, self-stopping, self-oiling, self-priming—self-operating in all respects. A complete set of instructions for installing is furnished with every outfit.

Fresh Drinking Water— Direct From the Well

Every electric-driven "Marvel" outfit has a fresh water outlet which automatically shuts off the pressure from the tank when the faucet in the fresh water line is opened and starts up the pump, delivering cold water *direct from the well*.

Equipment Specifications of System No. 2085

switch; pulley; spring belt tightener, flat belt; pressure gauge; water glass; relief valve; fresh water outlet; cast-iron sub-base or floor plate.

When Pump is Wanted Without the Tank

Frequently owners of hand-operated systems desire to replace their hand pump with a power-driven pump. For such installations, we have arranged to supply the "Marvel" pump only, without the tank, sub-base or piping connections, designated as Fig. 1685, and including the following equipment:

Equipment Specifications of Fig. 1685

"Marvel" electric house pump with electric motor; automatic switch; pulley; spring belt tightener and belting; air-charging device; fresh water outlet and pump stand.

Prices, Capacities, Etc.

When desired, No. 2085 will be furnished with 120-gallon galvanized iron tank at extra cost.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming "Marvel" House Pumping Outfit Gasoline Engine Driven For Wells and Cisterns 25 Feet Deep or Less System No. 2086

Where electric current is not available, we recommend the use of our gasoline engine driven "Marvel" outfit. This consists of the same pump used in System No. 2085 (see opposite page), $\frac{1}{2}$ H. P. engine, 30-inch x 6-foot black steel tank; spring belt tightener and belting; air charging device; pressure gauge; water glass; circuit breaker and relief valve. Pump and engine are mounted on a heavy plank base.

The engine is provided with a foot lever for starting, which, when pressed down upon with the foot, spins the engine. After testing and experimenting with different makes of gasoline engines, we have found that this engine is not only the most economical in operation, but is so simply constructed that anyone can learn to run it in a few minutes' time.

The automatic circuit breaker supplied with this system stops the engine when the tank is pumped up to 40 pounds pressure.

The steel tank in System No. 2086 is coated inside with a special anti-rust paint.

A complete set of instructions for installing and operating is furnished with every "Marvel" outfit.

When the Pump is Wanted Without the Tank

When desired, we will ship the "Marvel" pump and engine, *without the tank*, including equipment as below. This outfit is designated as Fig. 1686.

Equipment Specifications of Fig. 1686

"Marvel" house pump; $\frac{1}{2}$ H. P. air-cooled gasoline engine; spring belt tightener and belting; air-charging device; all mounted upon a heavy plank base.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming "Atlas" Water System No. 2009 With Gasoline Engine and "Atlas" Power Pump For Wells and Cisterns 25 Feet Deep or Less

This system will store water under 75 pounds pressure or less. The pump has a capacity of 575 gallons per hour at 60 revolutions per minute, and is fully described on the preceding pages. The engine is of the hopper-cooled type; four cycle; has hit-and-miss governor; will not freeze; has machine-cut gears; jump spark ignition; operates at 600 revolutions per minute. Diameter of engine pulley, 10 inches; face, 3 inches. It is one of the very best engines on the market. Book of instructions for operating engine is included with each "Atlas" system.

Amount of air to be pumped can be regulated by the air charging device on the pump. The usual maximum pressure maintained is 45 to 50 pounds. This makes a very good outfit for farms, suburban residences, factories, warehouses, etc.

Equipment Specifications of System No. 2009

One 30-in. x 8-ft. horizontal pressure tank.
One Fig. 691 "Atlas" double-acting power pump, 2½ in. x 5 in.; with air charging device and brass-lined cylinder; also Type "CI" drive; 20-in. x 3-in. pulley.
One 1½ horse-power reliable vertical gasoline engine with 10 feet of canvas belting.
One Fig. 904 1-in. check valve.

One automatic gasoline engine stop or circuit breaker.
One Fig. 900 1-in. globe valve.
One Fig. 1995 ¾-in. relief valve.
One Fig. 688 pressure gauge.
Two Fig. 917 ½-in. hose bibbs.
One Fig. 913 ¾-in. stop and waste cock.
One glass water gauge.

For complete details of the "Atlas" pump, see pages 164-167.

Sizes, Capacities, Etc.

If automatic gasoline engine stop is not wanted, a reduction in price will be made.
Hand Hole in Tank, furnished at extra cost.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming "Atlas" Water System No. 2012 With $\frac{3}{4}$ Horse-power Electric Motor and "Atlas" Power Pump For Wells and Cisterns 25 Feet Deep or Less

The pump is belted to the motor in this system, which practically eliminates all noise. System No. 2012 is, therefore, our most popular motor driven outfit. The automatic pressure regulator starts and stops the motor when the pressure falls or rises beyond a predetermined point. The "Atlas" pump has a capacity of 575 gallons per hour and is fully described on the preceding pages. Pump and motor are mounted upon a cast-iron sub-base, and are connected by a short belt. The cast-iron base insures permanent alignment of pump and motor.

We should be fully informed regarding the kind of current and the voltage available.

Equipment Specifications of System No. 2012

One 30-in. x 8-ft. horizontal tank.

One Fig. 691, $2\frac{1}{4}$ in. x 5 in. "Atlas" double-acting power pump with air charging device and brass-lined cylinder; with Type "C" drive (including cast-iron sub-base and 20-in. x 3-in. pulley).

One $\frac{3}{4}$ horse-power, A. C., single-phase, 60-cycle, 110-220 volt electric motor. Price will vary slightly, depending upon the kind of motor required. See list below.

One Fig. 1508 automatic pressure regulator.

Hand Hole in Tank, furnished at extra cost.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Deming Deep Well Water System No. 2016

With Electric Motor and Fig. 66 Power Working Head

For Wells 75 Feet Deep or Less

In this system the air is supplied to the tank by means of an air compressor, which is constructed as a part of the power working head, and which is operated from the pump crosshead.

Should no air be desired while the head is operating, a pet cock may be opened which will permit the escape of the air. This system has a capacity of about 250 gallons per hour, when working against a tank pressure of 60 pounds, and using a 2¼-in. x 10-in. artesian well cylinder in a 75-foot well. We should be fully informed regarding the kind of current and the voltage available.

Since conditions affecting deep well installations may vary greatly, different sizes of cylinders and motor are often required. It is best, therefore, to send us complete details before ordering a deep well outfit. However, for many installations, System No. 2016 will be satisfactory without alteration in equipment specified below.

Equipment Specifications of System No. 2016

Deming "Straight Line" Water System No. 2020 With Gasoline Engine and Fig. 1717 Head For Wells 100 Feet Deep or Less

In this system the air is supplied to the tank by means of an air compressor, which is located between the guide rods at top of the pump head, and is operated from the crosshead. Should no air be desired while the pump is running, a pet cock may be opened which will permit the air to escape.

Operating our Fig. 311, $2\frac{1}{4}$ x 10-inch brass cylinder at a depth of 100 feet, System No. 2020, when driven by $1\frac{1}{2}$ H. P. gasoline engine, will deliver 420 gallons of water per hour against 50 pounds pressure in the tank.

An automatic gasoline engine stop cuts out battery switch when pressure reaches desired point. Should power fail, lever is provided for hand operation. In deep well outfits it is advisable to send us complete details, since a cylinder of larger capacity may be used in wells of lesser depths than 100 feet. For complete details of Fig. 1717, see page 73.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming Deep Well Water System No. 2018

With Electric Motor, and Fig. 62 Power Working Head
For Wells 150 Feet Deep or Less

In deep well installations the pump head is usually located some distance away from the tank. For this reason, the piping in the above illustration is shown disconnected from the head.

With a Fig. 311, 2 $\frac{3}{4}$ -in. x 10-in. cylinder at a depth of 150 feet below the surface, this system will supply 600 gallons of water per hour against 60 pounds pressure in the tank.

When preferred, the connection between working head and motor is made by a short belt with tightener instead of gearing at the same price, this being designated as Type "C" drive.

Air for the pneumatic tank is supplied by the Fig. 63 air pumping device in the discharge head when the well cylinder does not exceed 3 $\frac{1}{4}$ inches inside diameter, but when a cylinder larger than 3 $\frac{1}{4}$ inches diameter is used, Fig. 64 air compressor attachment is furnished.

While the System No. 2018 as listed below will be satisfactory for most conditions where a capacity of not more than 600 gallons per hour is required (from a deep well), we nevertheless advise that full information as to the depth of the well, inside diameter of same and the discharge pressure required should be sent with the order.

For complete details of Fig. 62, see pages 182-183.

Equipment Specifications of System No. 2018

One 36-in. x 12-ft. horizontal tank.
One Fig. 62 power working head, with Type "B" drive and Fig. 63 air pumping device.
One Fig. 311, 2 $\frac{3}{4}$ -in. x 10-in. brass cylinder.
One 3 H. P. A. C. single phase, 60 cycle, 110-220 volt motor.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Triplex Pumps for Hydro-Pneumatic Service

For Use Where a Large Quantity of Water is Required

Fig. 50, Sizes $5\frac{1}{2}$ x 8 to $8\frac{1}{2}$ x 8 with Type "B" Drive
Capacity $5\frac{1}{2}$ x 8 size, 8800 gallons per hour

For installations where very large quantities of water are necessary, we recommend the use of our triplex pumps. These are made in capacities up to 60,000 gallons per hour. We also can supply hydro-pneumatic tanks with capacities of 20,000 gallons or less.

When the source of supply is at a much lower elevation than the point where the water is to be used, and also a considerable distance away, our triplex pumps are preferred.

We do not list any complete hydro-pneumatic outfits in which triplex pumps are used, for the reason that in large installations the conditions vary so very much that we prefer to handle such propositions as individual cases in order to determine the outfit best suited to existing conditions.

Such outfits usually consist of a Deming triplex pump, hydro-pneumatic tank, electric motor or gasoline engine, with the Deming air pumping device, and the necessary valves, gauges, etc.

Deming triplex pumps are especially adapted for hydro-pneumatic service in hotels, country estates, etc. When electric current is available, they may be automatically controlled. They are made in a great many different styles and sizes for varying conditions.

To quote intelligently we should know the quantity of water required per day; vertical distance from surface of water to the pump suction inlet and length of suction pipe; elevation from surface at well to point of delivery and length of discharge pipe. Give kind of motive power preferred; if electric current, state kind of current and voltage.

Alphabetical Index, Figure Index and Telegraph Cipher Code, Pages 249 to 254

Standard Hydro-Pneumatic Steel Tanks

With Convex and Concave Heads

These tanks are made of best open hearth flange steel with double riveted longitudinal seams, and are all tested to 125 lbs. air pressure. The prices below do not include water and pressure gauges or other accessories, but holes for pipe connections are tapped to suit conditions. *All tanks are painted inside with a special anti-rust paint.*

SPRAY PUMPS AND ACCESSORIES

FOR ALL
SPRAYING CONDITIONS

INCLUDING BUCKET, KNAPSACK, BARREL, TANK, COMPRESSED AIR, AND CART SPRAYERS FOR THE GARDEN, GREENHOUSE AND ORCHARD; INDEPENDENT POWER SPRAY PUMPS AND POWER SPRAYING OUTFITS FOR EXTENSIVE OPERATIONS; FIELD SPRAYERS, SPRAY NOZZLES, SPRAYING ATTACHMENTS, ETC.

A SEPARATE CATALOGUE

Of our complete line of spray pumps, nozzles and accessories, comprising many different types and sizes, will be sent upon request. However, to give a general idea of the appearance and construction of these pumps, a few representative types are listed in this section of the Catalogue.

The "Prize" Bucket Sprayer, Fig. 669

For Garden and Greenhouse Spraying

Without some type of bucket spray pump, no assortment of garden tools may be said to be complete. The "Prize" is much used for spraying small trees, garden truck, flowers and shrubbery; washing windows, porches, autos and buggies; applying whitewash and disinfectants in barns and poultry houses; applying cattle-fly oil, stock dip, etc.

This is our lowest priced spray pump, but it is often referred to as "much in little." The "Prize" is double acting, discharging one-half the solution on both the up and down stroke, giving a continuous spray. It is light; easy to carry; and is "built for business;" will develop a good pressure; is easy to operate; is practically non-breakable and will last for years.

Specifications

PUMP: The working parts of the pump are brass, including cylinder, plunger tube, plunger, valve seats and valve cages. The valves are solid brass balls, a true sphere to one one-thousandth of an inch. Nothing to rust or corrode. The ball valves insure a free movement of the liquid, as they are practically non-chokable.

AIR CHAMBER: The hollow plunger tube acts as an air chamber. The discharge chamber is brass.

HANDLE: The handle is made of malleable iron similar to that used on the "Success" Pumps.

HOSE AND NOZZLE: The "Acme" spray nozzle, our simplest, is used with 3 feet of $\frac{3}{8}$ -inch hose. The "Bordeaux," our patented adjustable nozzle for all spraying conditions, is furnished at additional cost.

FOOT REST is of malleable iron, 12 inches high, and clamps to the cylinder of pump.

SHIPPING WEIGHT, crated, is about nine pounds. The pump is put up in a strawboard box.

Outfit and Extras

"Perfect Success"

Fig. 968
"Handy Success"

Deming Bucket Spray Pumps

Fig. 659 is without doubt the most popular bucket spray pump on the market. Hundreds of thousands are in use all over the civilized world. It is similar to the "Prize" (see opposite page), except that it has a large brass air chamber, which produces a more uniform stream. For spraying a small number of trees; for flower and vegetable gardens, greenhouses, etc.; for washing windows, porches, autos and buggies; for applying whitewash and disinfecting barns and poultry houses, it is very useful.

HANDLE AND FOOT REST are malleable iron. Foot rest is clamped to cylinder and is 15 inches high—sufficient for any tall bucket.

HOSE AND NOZZLE—Furnished with three feet of $\frac{3}{8}$ -inch hose and "Bordeaux" nozzle. *Hose is attached with a hose band and is not wired on.* Shipping weight, crated, is about 10 pounds. Each pump is packed in a separate strawboard box.

Fig. 659—"Success" Pump, as illustrated Cipher, KORAN

Fig. 689—"Perfect Success," same as above, but with 4 feet of $\frac{3}{8}$ -inch hose, also malleable iron bucket clamp for holding pump firmly in bucket (*see illustration above*), so entire outfit may be carried from place to place by the bail when bucket is full of mixture Cipher, KILTER

Fig. 968, "Handy Success," consists of the "Success" pump mounted in a four-gallon tank, which may be had in brass or galvanized iron. This is a very popular outfit among florists, gardeners, stockmen and poultrymen. **HOSE AND NOZZLE:** Four feet of $\frac{3}{8}$ -inch hose and "Bordeaux" nozzle. Weight, boxed for shipment, is about 25 pounds.

The Deming Knapsack Sprayers, Figs. 675, 654

For Garden, Vineyard and Greenhouse

FIG. 675 — The "Success" Knapsack sprayer (the cut to the left) is a useful implement for the florist and grower of vegetables and small fruits. As a vineyard sprayer it is much used, but sprayers of large capacity are now more in use for this purpose. The brass tank is suitable for using lime-sulfur and bordeaux solutions.

FIG. 654 — "Prize" Knapsack sprayer (cut to the right) is similar to Fig. 675, except that the tank is of galvanized iron, and the "Prize" pump is used.

Specifications

PUMP: The working parts are same as the "Prize" and "Success" pumps shown on preceding pages. The cylinder, plunger, valves and valve seats being brass, corrosion and rust are eliminated. The lever is wrought iron and with malleable iron link, steel rod and wood handle.

TANKS are five gallons capacity. Fig. 675 has BRASS tank and dash disc agitator, operated from the pump lever. Fig. 654 may be fitted with agitator, when desired, at extra cost. Both outfits have drip cup for possible leakage; wide shoulder straps; and a gauze strainer under filling hole. Figs. 675 and 654 have carrying handles on top of tank and wide foot rest at bottom, for convenience when used like bucket pumps. When so used, lever may be detached and the extra handle affixed to the plunger rod. Fig. 654 has GALVANIZED IRON tank.

HOSE AND NOZZLE: These outfits have 4 feet of $\frac{3}{8}$ -inch hose with extension pipe 24 inches long; undersprayer, Fig. 962 (see page 215) and our "Bordeaux" nozzle (see page 214).

SHIPPING WEIGHT: The weights boxed for shipment are about 40 pounds.

The Deming "Aerospra," Fig. 663

(Patented. Trade-Mark Registered)
For Garden, Vineyard and Greenhouse

The "Aerospra" is the best and most durable compressed air hand sprayer on the market. It is convenient in all respects. *If the plunger is removed from the cylinder, it can be replaced without interference with the crimped plunger leather by placing it in the recessed cap of tank until the cap is attached again ready for operations.* The straps are for carrying it on the shoulders—or it can be carried by the handle, when carrying lock is attached—see the sectional view. The operator can pump up and spray at rest, until the reduced pressure requires pumping again. The tanks are tested up to 100 pounds pressure—more than twice the pressure which is obtained by the average operator. The sprayer is patented and the NAME "AEROSPRA" IS A REGISTERED TRADE-MARK.

Specifications

AIR PUMP: Brass tube cylinder, diameter 2 inches, stroke 12 inches. Top cap of tank attached to cylinder. A special rubber-packed flange tightens with the pressure. The locking and carrying clamp is of unique design. The cylinder valve is rubber and is very simple. The pump can be instantly removed for filling the tank.

TANK: MADE EITHER OF THE BEST QUALITY OF GALVANIZED SHEET STEEL OR SHEET BRASS. The carrying straps are wide for ease in handling. The diameter is 7½ inches and height 18½ inches, with about 3½ gallons capacity. The tank should be about two-thirds filled.

HOZE AND NOZZLE: There is a 3-foot section of ¾-inch hose with shut-off cock and fine spray nozzle.

SHIPPING WEIGHT: When boxed with all parts snugly packed ready for freight or express, the weight is about 20 pounds.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

The "Gardener's Choice" Sprayer, Fig. 651

For Garden and Field Work, Small Orchards, Etc.

This is one of the most convenient spraying outfits for general use. As an all-round utility sprayer it cannot be beaten. It is particularly adapted for both the garden and greenhouse, also for orchard use, as well as for spraying livestock in the barn and livery stable. It is a splendid whitewashing outfit, as the pump is strong and durable and has a good agitator. The working parts, including agitator, are shown in the sectional view above.

Specifications

PUMP has $1\frac{3}{4}$ -inch brass cylinder, brass ball valves with brass seat and cage, brass plunger and our special plunger packing. The leverage is six to one; can be worked against pressure of 100 pounds. The air chamber is ample, the base adding considerably to the capacity of the pipe air chamber.

AGITATOR: Twin paddle type, simple and effective; stirs the liquid thoroughly.

TANK AND CART: Twenty-four-gallon wood tank with steel hoops and hinged wood top. Leg, tongue and handle of wrought pipe. Metal wheels, diameter 24 inches, with staggered spokes and 2-inch tires. Special axle of wrought iron pipe held by long through bolts. Hub-to-hub measurement, 33 inches. Height to top of tank, 30 inches. Height to top of pump, 42 inches.

HOSE AND NOZZLE: Six feet of $\frac{1}{2}$ -inch "Deco" discharge hose and our "Bordeaux" nozzle are furnished. See list below for extra section of hose.

SHIPPING WEIGHT, including cart, when crated, is about 120 pounds.

Outfits and Extras

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

The "Planter's Tractor" Sprayer, Fig. 822

(Patented)

For Garden and Field Crops

FOR SPRAYING GARDEN AND FIELD CROPS two rows at a time, this is a splendid machine. It is a "one-man power" outfit, in which the pump is automatically operated from the wheel. OPERATES UNDER 40 POUNDS PRESSURE WHEN PUSHED AT ORDINARY SPEED.

When used for TREE SPRAYING ONLY the crosshead pin and connecting rod should be removed from the axle and pump lever, REVERSING THE PUMP AND TANK. This brings the pump lever convenient to the user, who can then attach an extra section of $\frac{3}{8}$ -inch hose and proceed to spray his trees and shrubbery.

Specifications

PUMP: $1\frac{1}{2}$ -inch brass tube cylinder, stroke is adjustable, $3\frac{3}{4}$, $2\frac{3}{8}$ or $1\frac{1}{2}$ inches. Air chamber is augmented by hollow brass plunger tube. The plunger, valves and seats are brass. Lever is steel. The agitator is of dash-disc type operated from rod attached to plunger tube.

TANK: GALVANIZED OR BRASS, 10-GALLON; detachable. Iron top and lid; bottom reinforced.

FRAME: Handles of steel pipe bent to shape, and attached to uprights, carrying the tank. Axle bearings clamped to ends of handles, forming the frame. Structure rigidly supported by steel braces, forming the legs.

WHEEL: Diameter, 24 inches, with 3-inch tire. Hub is welded to axle.

DISCHARGE EQUIPMENT: Two sections of $\frac{3}{8}$ -inch hose 2 feet long; two $\frac{3}{8}$ -inch stop cocks; two $\frac{1}{4}$ -inch hose pipes 18 inches long; two "Demorel" nozzles with angle discharge for rows up to 48 inches apart; forward or backward spray for shorter or taller plants.

SHIPPING WEIGHT, when crated, about 150 pounds.

The "Major" Barrel Sprayer, Fig. 832

For Spraying Small and Medium-Size Orchards

For the farmer who has either a young or old family orchard, this is an excellent pump. It has a smaller diameter cylinder than the "Century" (see following page), and for this reason is adapted for use with one lead of hose and one nozzle only. The "Major" clamps to the chime of the barrel and is also firmly secured to the bottom of barrel by an anchor pin which fits into a recess in the pump. This device may be quickly and easily attached to any barrel. Other pumps of this type without this anchor device will not remain rigid and are very annoying to operate.

The "Major" is also much used for disinfecting the farmyard, barns, poultry houses and stock pens; spraying stock dip and cattle-fly oil; for whitewashing buildings and fences; for deodorizing and purifying cellars, vegetable bins, dairy rooms, etc. The "Major" will develop a powerful pressure; is practically proof against corrosion, as all working parts are brass; is easy to operate; and is the best pump on the market for the price. *The barrel is not furnished; any good barrel may be used.*

Specifications

PUMP: Sets low in barrel. Fastens to chime of barrel by turning one clamp screw. Held rigid by anchor pin on bottom of barrel.

CYLINDER: Removable 2-inch seamless drawn brass; always submerged and primed. **PLUNGER** has special fabric packing—chemically treated. Will not require replacing for two or three seasons.

VALVES: Solid bronze ball valves and bronze valve seats. By removing two bolts, both suction and discharge valves may be taken out for examination or repair.

AIR CHAMBER: Two-inch heavy steel tubing. Ample capacity for one section hose. Reduces effort of pumping.

AGITATOR: Twin paddle type. Simple and effective for stirring solution.

FITTINGS: Brass gauze strainer; discharge connection fitted for one lead of $\frac{1}{2}$ -inch hose.

SHIPPING WEIGHT: Pump only, about 50 pounds.

Outfits and Extras

Fig. 832 — "Major" sprayer only; discharge fits regular $\frac{1}{2}$ -inch female half hose coupling

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

The "Century" Barrel Sprayer, Fig. 645

The Premier of all Barrel Sprayers

For more than twenty years, the "Century" has maintained its leadership among barrel sprayers. Thousands of "Centuries" are now in use all over the civilized world. Leading growers and horticultural experts all combine in pronouncing it the "best all-around barrel sprayer on the market." At the National Horticultural Congress, the "Century" was awarded first honors, winning out over six other well-known makes.

It has a larger capacity than the "Major" (see preceding page), and will supply two leads of hose and two nozzles. In addition to spraying orchards, etc., it is widely used for disinfecting farmyards, barns, poultry houses and stock pens; spraying stock dip and cattle-fly oil; white-washing buildings and fences; disinfecting and purifying cellars, vegetable bins, dairy rooms, etc.

The "Century" is proof against corrosion, as all working parts are brass; is so substantially constructed as to be practically exempt from breakage; is easy to operate and is absolutely the best barrel pump that money can buy. *The barrel is not furnished.*

Specifications

PUMP: Sets low in barrel. *Universal iron base*—adjustable to any size or depth of barrel—fits the *flat head* or *curved side* of barrel. This, with foot lug, keeps pump absolutely rigid during operation. Base fits 7 x 10-inch hole. Liquid is poured through a filling hole in base. Four hook bolts with large thumb nuts attach base to barrel head. Easy to remove pump from barrel.

CYLINDER: Renewable 2¼-inch seamless drawn brass. Four-inch stroke. Always submerged and primed. Plunger has special fabric packing, chemically treated.

VALVES: Solid bronze ball valves and bronze valve seats. By removing four bolts, both suction and discharge valves may be taken out for examination or repair.

AIR CHAMBER: 2½-inch heavy steel tubing, 32 inches long. Reduces effort in pumping.

AGITATOR: Twin paddle type. Simple and effective for stirring solution.

FITTINGS: Brass gauze strainer. Brass discharge "Y" for two leads of ½-inch hose.

SHIPPING WEIGHT: Pump only, carefully boxed, 75 pounds.

Outfits and Extras

The "Farmer's Friend" Sprayer, Fig. 647

For Spraying Field Crops, Orchards, Etc.

A most convenient outfit for either field, vineyard or orchard work. The U. S. Government is using large numbers of these outfits at home and abroad for spraying, disinfecting and white-washing.

No lifting of heavy barrels of mixture into and out of farm wagons. The "Farmer's Friend" is always ready for business as soon as barrel is filled.

For spraying field crops, our four-row field sprayer, Fig. 653 (see opposite page) is recommended.

Specifications

PUMP: The "Century" barrel pump. For complete description of pump see page 207.

AGITATOR: Twin paddle type. Keeps liquid well stirred.

TANK AND FRAME: The tank is a 50-gallon barrel set lengthwise on strong steel supports. Thills and platform are of wood and well constructed. Shafts and platform are of hardwood with plenty of space for a man to stand on platform for driving and pumping.

WHEELS AND AXLE: Wheels are steel; diameter, 44 inches; width of tire, 3 inches. Axle is 1½-inch steel shafting. Wheels are fitted for 56-inch tread.

FITTINGS: A three-way stop cock is fitted to pump discharge so that two leads of hose may be used if necessary, although but one 12½-foot section of ½-inch "Deco" hose and "Simplex" angle nozzle are regularly supplied. We recommend the use of an extension pipe with this outfit when used for orchard spraying. See page 216.

SHIPPING WEIGHT: Knocked down and crated, is about 500 pounds.

Outfits and Extras

Fig. 647 — "Farmer's Friend" sprayer, complete with pump, hose, etc., as illustrated and described CIPHER, KERNING

Additional price for extra lengths of hose. Extension pipes, stop cocks, etc., on pages 215 and 216.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

The Deming Four-Row Field Sprayer, Fig. 653

For Potato Plants and Other Field Crops

For spraying potatoes, strawberries, small nursery stock, cotton fields, etc., this is a very convenient device, as it is easily and quickly attached to any wagon.

The nozzle holders can be adjusted to rows of any width from 22 to 40 inches for forward or backward spraying. They may be raised or lowered and brought together to pass through gate. OUR "CENTURY" OR LARGER SPRAYERS CAN BE USED.

Specifications

ATTACHMENT: For any wagon or cart. Can be securely clamped on with set screws and bolts which are furnished.

ADJUSTMENT: Height for spraying and width of rows can be easily arranged by the lock lever. Width of rows from 22 to 40 inches.

HOSE AND NOZZLES: There are two sections of $\frac{3}{8}$ -inch hose connecting to the outer nozzles and two sections of $\frac{1}{2}$ -inch hose connecting to coupling in center, to which discharge hose of pump is attached. Four "Simplex" nozzles are used.

SHIPPING WEIGHT: Partially crated to prevent breakage, is about 80 pounds.

Outfits

Fig. 653 — With four "Simplex" nozzles and hose sections, also coupling for discharge hose connecting to pump as per detail engraving CIPHER, KATYDID
Section of $\frac{1}{2}$ -inch "Deco" sprayer hose, 8 feet long, with couplings for attaching field sprayer to discharge of spray pump CIPHER, KANTRY

Fig. 633

Fig. 933

“Samson” Double-Acting Sprayer, Fig. 633 and Outfit, Fig. 933

The next best outfit to a power machine, *and the easiest working hand sprayer on the market.* Will develop a pressure of 150 to 175 pounds while supplying two leads of hose, and at the same time, permit the operator to rest between strokes, because of the unusually large air chamber and extra long lever. Is proof against corrosion and practically exempt from breakage.

Does speedy, thorough work. Thousands now in use. Positively the latest and best development in hand spraying, and a decided success from the start.

Specifications Fig. 633

PUMP: Differential plunger, discharging equal amount of water at each stroke. Working parts accessible; brass cylinder linings and ball valves easily removed. Furnished with wood platform, 10 feet of 1-inch suction hose and strainer; pressure gauge and double discharge attachment. Discharge hose, nozzles, etc., extra; see pages showing accessories.

CYLINDER: Differential; brass; solid bronze ball valves and seats; special fabric packing—chemically treated to resist corrosion.

AIR CHAMBER: Steel tube; seven gallons capacity; makes pumping easy.

SHIPPING WEIGHT, crated, about 175 pounds.

Specifications Fig. 933

PUMP on large platform with following additional equipment: 50-gallon barrel; 1-inch suction pipe (instead of hose) and strainer; agitator, operated from lever; 25 feet $\frac{1}{2}$ -inch “Deco” discharge hose with double spraying attachment and two “Simplex” nozzles; Fig. 751 bamboo extension, 10 feet long, with drip shield. A wrench is provided with which to loosen the suction pipe, thus preventing siphonage of the mixture from the pump.

Outfits and Extras

Additional charge for extra hose

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Deming Duplex Plunger Pump, Fig. 761 For Operation by Any Gasoline Engine

This is the pump regularly supplied on our complete power sprayers. Many growers who already have an engine prefer to assemble their own outfits and we, therefore, list this pump separately. The pulley may be changed to fit any engine speed.

MAIN CASTINGS ARE SEPARATE.

The base, columns and air chamber on Fig. 761 are separate castings. Should breakage occur because of accident, this construction reduces cost of repairs.

CYLINDERS AND PLUNGERS: Deming cylinders are made of cast bronze, bored absolutely true. The plungers are of close-grained gray foundry iron. Plunger packing consists of a chemically-treated leather crimp which wipes the cylinder free from solution at every stroke.

THE VALVES: Deming valves consist of solid bronze balls. The valve seats are cast bronze and will not break, chip, corrode, wear out or become loosened from the seat.

THE SUCTION VALVE COVERS are not screwed in but are held in place by a yoke. This yoke can be removed by unscrewing *one nut*. The valve covers can then be lifted out, exposing the suction valves. The discharge valves are of the same construction. Nothing could be simpler.

DRAINAGE: Suction and discharge ports are equipped with drainage plugs to prevent freezing.

Equipment Furnished With Fig. 761

Belt tightener; pressure gauge; relief valve; double discharge cock; 10 feet of 1-inch suction hose and strainer.

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

Deming "Victory Junior" Power Sprayer, Fig. 729 With 4¼-gal. Pump, 2 H. P. Engine and 150-gal. Tank

The Deming "Victory Junior"—View From Right Side

For spraying orchards of 8 to 10 acres or more, a power rig is essential. Deming Power Sprayers may be mounted on any standard farm wagon truck, as they are furnished with adjustable bolster pieces. In the construction of the "Victory Junior" we use the Fig. 761, No. 1 pump, described on preceding page; 2 H. P. Novo engine and 150-gallon tank.

The pump is good for 250 pounds pressure—more than is required for successful spraying.

NOTE: *The "Victory Junior" will supply two nozzles with large hole discs or four nozzles with small hole discs. Nozzles with large hole discs are regularly furnished.*

If it is desired to use two leads of hose, the small hole discs should be specified.

We recommend the use of our "Comet" spray gun, *with small hole disc*, in connection with "Victory Junior."

Equipment Regularly Supplied with the "Victory Junior" Power Sprayer, Fig. 729

DUPLEX PUMP: Capacity, 4¼ gallons per minute at 70 revolutions.

ENGINE: 2 H. P. Novo; batteries and wiring.

TANK: 150 gallons with manhole and propeller agitator; a hinged cab encloses both the pump and engine.

ACCESSORIES: Suction box and clean-out strainer; double discharge cock for two leads of hose; One 25-foot section of ½-inch "Deco" high pressure discharge hose, with couplings, double spraying attachment and two "Simplex" angle nozzles;

One Fig. 751 brass-lined bamboo extension pipe, 10 feet long, with leakless stop cock; Pressure regulator; pressure gauge; tool box containing oil can, monkey wrench and spanner for stuffing box of pump; hooks for coiling hose when not in use; holders on top of tank for extension pipes; foot rest; all complete as illustrated, ready to mount on any wagon truck and commence operations.

Deming "Victory" Power Sprayer, Fig. 730 With 8-Gallon Pump; 3-H. P. Engine and 200-Gallon Tank

The Deming "Victory"—View from Left Side

In the "Victory," we have used Fig. 761, No. 2 (page 211) with 3 H. P. Novo engine and 200-gallon tank.

This makes a larger and more powerful outfit than the "Victory Junior" and is especially adapted to large commercial orchards.

Inspection and Test

A rigid test and inspection of each Deming Power Sprayer is made before it is permitted to leave the factory—the pump being subjected to a high pressure that would inevitably disclose any flaws or weaknesses. Both the pump and engine are most carefully adjusted. Unless such precautions are taken, annoying delays are apt to be experienced the first few times the outfit is used. But Deming outfits will be found "ready for business" as soon as uncrated.

Equipment Regularly Supplied with the "Victory," Fig. 730

DUPLEX PUMP: Capacity, 8 gallons per minute at 60 revolutions.

ENGINE: 3 H. P. Novo; batteries and wiring.

TANK: 200 gallons with manhole and propeller agitator; hinged cab enclosing pump and engine with roll curtains to further protect machinery.

ACCESSORIES: Suction box and clean-out strainer; double discharge cock for two leads of hose; Two 25-foot sections of $\frac{1}{2}$ -inch high pressure "Deco" discharge hose, with couplings, double spraying attachment and four "Simplex" angle nozzles;

Two Fig. 751 brass-lined bamboo extension rods, 10 feet long, with leakless stop cock on each; Pressure regulator; pressure gauge; tool box containing oil can, monkey wrench and spanner for stuffing box on pump; hooks for coiling hose when not in use; holders on top of tank for extension pipes; foot rest; all complete as illustrated, ready to mount on any wagon truck and commence operations.

OPTIONAL EQUIPMENT: One 50-foot section of hose and fittings as above, and one Deming "Comet" spray gun.

The Deming Spraying Nozzles

THE MANUFACTURE OF SPRAY NOZZLES requires great care in the machine work. Special machinery and tools enable us to make perfect nozzles. Perfect brass castings only are used and EVERY NOZZLE IS TESTED before it leaves our works.

A SPRAYER'S EFFICIENCY IS IN THE NOZZLE — THE "BUSINESS END." Without a good nozzle any spraying outfit is inefficient. The Deming patent spray nozzles, shown above, are "The World's Best." They can be used with any spray pump.

HOW DEMING NOZZLES ARE PUT UP: — All the DEMING NOZZLES illustrated above are put up in individual paper boxes except Fig. 960, as listed below. Complete directions for using the nozzles are printed on each nozzle box. The "BORDEAUX" patent nozzle, when so ordered, is put up for dealers in cartons containing a dozen nozzles.

- Fig. 965 — "Bordeaux" is furnished with many of our sprayers. It is the best general purpose spray nozzle ever produced. Throws a solid stream, coarse long-distance spray, or a fine mist; or it may be shut off. It is an excellent nozzle also for whitewashing, disinfecting, etc. Easily disgorger. THE NAME "BORDEAUX" IS A REGISTERED TRADE-MARKCIPHER, KEEPSAKE
- Fig. 766 — "Simplex," light, durable and compact. Adapted for high pressure. Has two interchangeable steel spray discs, one coarse and one medium-fine spray. Does not waste liquidCIPHER, KEMTV
- Fig. 766½ — "Simplex" angle nozzle, similar to Fig. 766.CIPHER, KILT
- Fig. 753 — "Demorel," similar to "Vermorel," but somewhat lighter in weight, with caps for fine and coarse sprays. Steel caps, instead of brass, when ordered. (PAT-ENTED)CIPHER, KERONA
- Fig. 963 — "Vermorel," with caps for fine and coarse sprays. Obstructions readily forced out with spring disgorger. Steel caps, instead of brass, when specified. (PAT-ENTED)CIPHER, KEFFEL
- Fig. 866 — "Giant Simplex" nozzle, *with strainer* and arch spray disc, similar to Fig. 766, but larger, for extensive operations and high pressureCIPHER, KNAGGED
- Fig. 866½ — "Giant Simplex Angle" nozzle, *with strainer*, similar to Fig. 866CIPHER, KNOCK
- Fig. 754 — "Eureka," throws conical-shaped spray; disgorges by pushing against fence or tree. A good whitewasher.CIPHER, KNITCH
- Fig. 960 — "Acme," will throw a solid stream or a fine spray. Furnished on "Prize" bucket sprayers.CIPHER, KELPIE

REPAIRS OR EXTRA PARTS

The repair parts listed in this section embrace our most popular hand and windmill pumps; iron and brass cylinders, hydraulic rams, power pumps, spray pumps, etc.

If repairs are desired for a pump not given in this repair list, we should be informed concerning the symbol number which is cast on the pump part; and any other details such as descriptive diagram, weight, etc. The comprehensive figure index below will make it possible to quickly find the page on which the desired repairs are listed.

USEFUL TO THE ENGINEER,
ARCHITECT AND MANUFACTUR-
ER; ALSO TO DEALERS IN AND
USERS OF PUMPS IN GENERAL,
SUCH AS FACTS, FORMULAS AND
RULES RELATING TO HYDRAU-
LICS AND PNEUMATICS, INCLUD-
ING CAPACITIES, POWER, AND
SPEED OF PUMPS AND THEIR
OPERATING FACTOR**

Useful Technical Information

THE AREAS OF CIRCLES are to each other as the square of their diameters. Doubling the diameter of a pipe or cylinder increases its capacity four times. Friction of liquids in pipes increases as the square of the velocity.

ATMOSPHERIC PRESSURE at sea level is usually estimated at 14.7 pounds per square inch, and this pressure will maintain a column of water 33.9 feet high when the normal pressure in the column is relieved by the creation of a vacuum. This is the theoretical distance that water may be drawn by suction. In practice, however, pumps should not be placed over 20 to 25 feet above the water supply, and nearer if possible.

EVERY FOOT OF HEIGHT in a column of water represents .434 pounds pressure to the square inch. It is common practice to estimate that every foot in height is equal to one-half pound pressure per square inch, as this allows for ordinary friction in pipes.

A GALLON OF WATER WEIGHS 8.33 pounds, and contains 231 cubic inches. A cubic foot of water weighs 62.36 pounds, and contains 1,728 cubic inches, or 7.48 gallons.

A MINER'S INCH OF WATER is approximately equal to 11½ U. S. gallons per minute.

Rules to Determine the Size and Speed of Pulleys or Gears

The Driving pulley is called the Driver, and the Driven pulley the Driven.

If the number of teeth in gears is used instead of diameter in these calculations, number of teeth must be substituted wherever diameter occurs.

TO FIND THE DIAMETER OF THE DRIVER, the diameter of Driven and its revolutions, and also revolutions of Driver being given: Multiply the diameter of Driven by its revolutions, and divide the product by the revolutions of Driver; the quotient will give the diameter of Driver.

TO FIND THE DIAMETER OF THE DRIVEN, the revolutions of Driven, also diameter and revolutions of Driver being given: Multiply the diameter of Driver by its revolutions, and divide the product by the revolutions of Driven; the quotient will give the Diameter of the Driven.

TO FIND THE REVOLUTIONS OF THE DRIVER, the diameter and revolutions of the Driven, also diameter of the Driver being given: Multiply the diameter of Driven by its revolutions, and divide the product by the diameter of Driver; the quotient will give the revolutions of Driver.

TO FIND THE REVOLUTIONS OF THE DRIVEN, the diameter and revolutions of the Driver, also diameter of the Driven being given: Multiply the diameter of Driver by its revolutions, and divide the product by the diameter of Driven; the quotient will give the revolutions of Driven.

Data on Air Compression

FRANK RICHARDS, M. E.

AIR COMPRESSION FROM ONE ATMOSPHERE, AT SEA LEVEL, 60° FAHRENHEIT						HORSE POWER (THEORETICAL)

The theoretical horse power required to elevate water is found by multiplying the gallons pumped per minute by the total lift (including friction) in feet, and dividing by 4000. To get the actual horse power required, divide the theoretical power obtained from the table above by the efficiency of the pump expressed as a decimal.

*Vedro and Pood are a Russian measure and weight respectively.

A common water pail holds 19 pounds, or 2.272 U. S. gallons.

CONVENIENT TO KNOW: A miner's inch of water equals approximately 11½ U. S. gallons per minute.
(One metre equals 39.37 inches, or 3.281 feet.)

In making Weir measurements, place a board or plank in the stream at the point so that a pond will form above it. A rectangular notch is cut in it large enough so that all the water will flow over the notch. The length of the notch should be from two to four times its depth. The edges should be beveled to slope outward in the direction of the flow of the water. In the pond about six feet above the Weir a stake should be driven so that its top is precisely level with the bottom of the notch, and at some convenient point for measuring. The depth of the water flowing over the Weir may then be ascertained by an ordinary rule, placed on top of the stake, measuring to the surface of the water, and the quantity figured from the table above.

When pipe is slightly rough, add 15 per cent. When very rough, add 30 per cent.
 Vel.—Velocity in feet per second. Fric.—Friction head in feet.
 Table shows loss for one elbow, and is based on Weisbach's Formula for short radius bends.

Water Required per Minute to Feed Boilers

(Using the "Centennial Standard"—30 pounds or 3.6 gallons of water per horse power per hour, evaporated from 100° F. to 70 pounds steam pressure per square inch.)

H. P. Boiler	Feed Water Gallons	H. P. Boiler	Feed Water Gallons	H. P. Boiler	Feed Water Gallons	H. P. Boiler	Feed Water Gallons	H. P. Boiler	Feed Water Gallons

Sizes of Single-Acting Triplex Pumps Recommended to Feed Boilers

While 30 pounds of water per horsepower per hour is the usual basis of estimate, this table is based on 36.6 pounds per hour, giving a reasonable amount of excess supply.

200	461.9	172.6	423.	535								

NOTE.—The actual quantities will vary from these figures, the amount of variation depending upon the shape of nozzle and size of pipe at the point where the pressure is determined. With smooth taper nozzles the actual discharge is about 94 per cent. of the figures given in the tables.

TELEGRAPH CODES *AND* INDEXES

FOR

CONVENIENCE OF PATRONS

EMBRACING FIGURE INDEX ARRANGED BY FIGURE NUMBERS, CONSECUTIVELY; AND ALPHABETICAL INDEX ARRANGED BY NAME OF ARTICLE. THE TELEGRAPH CIPHER CODE DEFINES SENTENCES RELATING TO ENQUIRIES AND PRICES; ALSO ORDERS AND THEIR EXECUTION.

Telegraph Cipher Code

For the accommodation of those desirous of making inquiries, or placing orders by telegraph, we append the following code, the use of which will often save considerable expense.

A great part of the articles listed in this catalogue are given cipher words by which they may be ordered by telegraph.

OUR CABLE ADDRESS IS "DEMING, Salem, Ohio."

We also use Lieber's, Bentley's, the A. B. C. 4th and 5th Edition, and Western Union Telegraphic Codes. When using either of these special Codes, add to telegram the word "Lieber" for the Lieber Code; the word "Alphabet" for A. B. C. 4th and 5th Editions, and the word "Western" for Western Union Telegraphic Code, etc.,

Concerning Orders, Quotations and Shipments

PADDLING . . .	How soon could you ship if ordered at once?	PINAFORE . . .	We have no reply to our telegram of.
PADDLE . . .	We have in stock.	PIPPIN . . .	Have you received our letter of . . . regarding . . .
PALENESS . . .	When will you ship?	PISTOLET . . .	We do not understand your telegram by cipher code, repeat it using regular language.
PASTORATE . . .	Enter our order for . . . specifications for which follow by mail.	PITCHING . . .	Write us fully in regard to matter in our letter of . . .
PASSWORD . . .	Do not ship our order of . . . until advised by us.	PITIABLE . . .	When you receive our letter of . . . please telegraph reply.
PASTRY . . .	Ship what you have in stock, and let balance follow as soon as possible.	PROBATE . . .	Referring to your letter of . . .
PATHETIC . . .	Ship immediately by freight.	PROBE . . .	Referring to our letter of . . .
PATHOS . . .	Ship immediately by express.	PROBOSCIS . . .	Answer by telegraph.
PEERDOM . . .	We can ship. . .	PROCLAIM . . .	Mail blue-print of . . .
PEEVISH . . .	We will ship. . .	PROCTOR . . .	Referring to your telegram of . . .
PETULANT . . .	Answer by telegraph at our expense.	PRODDING . . .	Referring to our telegram of . . .
PINDAR . . .	We have received no letter from you in regard to . . .	PROFFER . . .	Answer by mail.

Concerning Classes of Goods

PACATION . . .	Pump fitted with bronze plungers and bronze-lined stuffing boxes and glands.	PLATOON . . .	Fitted for 1½-inch Suction Pipe.
PACING . . .	Pump fitted with brass cased plungers and bronze-lined stuffing boxes and glands.	PLATTER . . .	Fitted for 2-inch Suction Pipe.
PIMENT . . .	Pump with all-bronze water end.	PLAUDIT . . .	Fitted for 2½-inch Suction Pipe.
PADRA . . .	Complete with . . . H. P. motor.	PLAUSIBLE . . .	Fitted for 3-inch Suction Pipe.
PAGODA . . .	For . . . volt, direct current.	PLAUSIVE . . .	Fitted for 1-inch Discharge Pipe.
PALING . . .	For . . . volt, alternating current. . . . phase, . . . cycles.	PLASTRON . . .	Fitted for 1¼-inch Discharge Pipe.
PLATEN . . .	Fitted for 1 -inch Suction Pipe.	PLAYFUL . . .	Fitted for 1½-inch Discharge Pipe.
PLATONIC . . .	Fitted for 1¼-inch Suction Pipe.	PLAYING . . .	Fitted for 2-inch Discharge Pipe.
		PLEADING . . .	Fitted for 2½-inch Discharge Pipe.
		PLEADER . . .	Fitted for 3-inch Discharge Pipe.

Complete Table of Contents and General Classification of Pumps, Pages 7 and 8

Alphabetical Index

	PAGE		PAGE
Accessories, Metal and Glass, for Pumps	105	Drive Well Points	108
Accessories, Spraying	213-215	Drive Well Pumps	32-41
Acid Pumps	139-147	"Duplex" Outside-Packed Plunger Spraying Pump	211
"Acme" Spraying Nozzle	214	Electric Mine Pumps	154-157, 170-174
"Aerospra" Compressed Air Sprayer	203	Electric Driven Pumps	142-144, 154-162, 164-174
Air Chambers for Discharge Pipe	102	Electric House Pumps	160-161, 164-167, 190-191
Air Compressors	135	Elevator Pumps	154-155
Air Cylinder for Deep Wells	80	"Eureka" Spraying Nozzle	214
"Ajax" Double Acting Piston Pump	172-173	Factory Pumps, Miscellaneous Hand and Power	122, 125, 128-129, 154-155, 164-186
Artesian Well Cylinders	88-89	"Farmer's Friend" Sprayer	208
Artesian Well Plungers and Valves	79, 81	Field Sprayer, Four-Row	209
"Atlas" Double-Acting Power Pump	164-167	Fire Extinguishers	125
"Atlas" Hydro-Pneumatic Water Systems	192-193	Fittings for Pipe	97
Automobile Rotary Gasoline Pumps	145	Foot and Float Valves	101-102
Automobile Plunger Gasoline Pumps	124	Force Pumps for Plumbers' Use	122-123
Bilge Pumps	115, 116	Force Pumps, Hand Rotary	139-141
"Blue Special" House Force Pump	20	Force Pumps, Hand and House	16-28
Boiler Feed Pumps, Hand, Single Plunger	123	Force Pumps, Power Rotary	142-144, 146-147
Boiler Feed Pumps, Power	154-155	Force Pump Standards, Hand and Windmill	50, 57-68
Boiler Testing Pumps	122-123	Force Pumps, Well, Hand	38-48
"Bordeaux" Spraying Nozzle	214	Garage Pumps, for Gasoline	124, 145
Bottom Cylinder Cap with Valve	81	Garden Pumps, for Spraying	204-205
Brass and Brass-lined Cylinders	83-90	Garden Pumps, Hand, Irrigating	26-27, 113-116
Brass Goods	104-105	"Gardener's Choice" Sprayer	204
Brass Valve Seat	79	Gas Engine Cooling Pumps	142-144
Brine Circulating Pumps 142-144, 154-157, 160-161, 169-174		Gasoline Garage Pumps	124, 145
Centrifugal Pumps	148-150	Gate Valves, Globe Valves and Check Valves	104
"Century" Barrel Sprayer	207	Gauges, Water and Pressure	109
"Century" Whitewashing Outfit	128	"Gem" Hose Nozzle	106
Cistern Pumps, Lift and Force	15-16	"Giant" Double-Acting Thresher Tank Pumps	114
"Climax" Double-Acting House Force Pumps	26-27	"Giant Simplex" Spraying Nozzle	214
"Climax" Water Systems	189	Goose Neck Spouts	102
"Clock Pumps," with Wing Valves	24-25	Grease and Oil Cups	105
Cocks and Valves, Brass	104	Greenhouse Pumps for Water Supply	164-167, 189-196
Cog Lever Pumps	33, 47-48, 61, 66-67, 114	Greenhouse Pumps, for Spraying	200-207
"Colonial" Quick Return Force Pump	127	Hand and House Force Pumps	16-28
"Comet" Spray Gun	216	Hand and Power Pumps, Miscellaneous	113-136
Compressed Air Sprayers	203	Handle Balls	102
Contractors' Pumps	116-117, 148-150	"Handy Success" Bucket Sprayer	201
Creamery Pumps	130-131, 142-144	Heads, Power Working	177-185
Current Breakers	109, 110	Horizontal Hand Force Pumps	26-27, 114
Cylinders and Accessories	78-94	Horizontal Double-Acting Piston Pumps, Power	164-174
Cylinders, Artesian Well, Brass	88-89	Hose, "Deco" Special Spraying	106, 216
Cylinders, Brass-lined, Iron	83, 91	Hose Couplings	215
Cylinders, Iron	82, 91	Hose, Discharge and Suction	106
Cylinders, Irrigating	91, 94	House Force Pumps	16-28
Cylinders, Seamless Brass Body	84-90	House Lift Pumps	12-15
"Deco" Special Spraying Hose	106, 216	House Pumping Outfits	189-196
Deep Well Pump Standards	72-75, 178	How to Install Deming House Lift and Force Pumps	11
Deep Well Power Working Heads	177-185	Hydraeram	134
Deep Well Pump Heads	177	Hydraulic Hand Pumps for Plumbers	122-123
Deep Well Triplex Pumps	186	Hydraulic Rams	132-133
"Demorel" Spraying Nozzle	214	Hydro-Pneumatic Steel Tanks	198
Diaphragm Suction Pumps for Hand and Power 116-117		Hydro-Pneumatic Water Systems	189-198
Discharge Hose	106	"Ideal" Double-Acting Oscillating Pumps	24-25
"Domestic" Kitchen Pump	13	Iron Cylinders	83, 91
Double-Acting Belt-Driven Spray Pump	211	Irrigating Pumps	94, 148-150
Double-Acting Hand Force Pumps	24-27, 113, 114	Knapsack Sprayers	202
Double-Acting House Force Pumps	24-27	Leathers for Plungers and Lower Valves	92-93
Double-Acting Power Pumps	164-174	Lever Handle Bibbs and Stops	104
Drives for Power Pumps, Types of	155, 157, 161-162	Lift Pumps, Set-Length	32-37
Drive Cap, Malleable	108		

Engineering Tables and Information Relating to Hydraulics, Pages 239 to 248

HAND AND POWER PUMPS FOR ALL USES

Alphabetical Index—Continued

	PAGE		PAGE
"Little Giant" Hydraulic Pressure Test Pump . . .	122	Rubber Hose and Tubing	106, 216
Lower Valves and Valve Seats	81	"Samson" Double-Acting Sprayer	210
"Major" Barrel Sprayer	206	Set-Length Lift and Force Pumps	32-48
Malleable Fittings	97	Ship's Deck Pumps	26-27, 113-115
"Marine" Bilge Pumps	115	"Simplex" Spraying Nozzle	214
"Marine" Irrigating Pumps	94	Single-Acting Triplex Plunger Pumps	154-161
"Marvel" Electric House Pump	190	Sink Bracket for Pitcher Pumps	103
"Marvel" Water Systems	190-191	Sinks, Cast Iron, Enameled	103
"Mascot" Pipe Standard Lift Pumps	34	Siphon Force Pumps, Hand and Windmill	118-120
Mine Pumps	154-155, 164-174	Southern Lift and Force Pump	126
"Neptune" Double-Acting Piston Pump	174	Spout Hose Clevis	102
"New Era" Double-Acting House Force Pumps	17	Sprayers, Barrel	206-207, 210
Non-Freezing Hand and Windmill Pumps	32-48	Sprayers, Bucket	200-201
Nozzles, Spraying	214	Sprayers, Field	208-209
Oil Pumps, Power Rotary	147	Sprayers, Compressed Air and Knapsack	202-203
Oil Pumps, Horizontal Power	169	Sprayers, Power, and Outfits	211-213
Orchard Sprayers	206-213	Spraying Accessories	215-216
Oscillating Force Pumps, with Wing Valves	24-25	Spraying Nozzles	214
Outlet Valves	102	Stop Cocks, for Spraying Outfits	215
Paper Mill Pumps	154-159	"Straight Line" Pumps and Working Heads	71-76
"Peerless" Cog Lever Force Pumps	47-48	Strainers, Suction, for Pipe and Hose	100
"Peerless" Windmill Force Pumps	43-48	"Success" Bucket and Tank Sprayers	201
"Peerless" Double-Acting Force Pumps	43-48	Suction Strainers	100
"Perfect Success" Bucket Sprayer	201	Sucker Rod and Joints	99
Pipe Fittings	97	Suction Hose	106
Pipe Holders, Lifters and Pullers	107	Sugar House Pumps	154-161, 170-174
Pipe Standard Lift and Force Pumps	34-35, 38, 40, 66-67	Tanks for Hydro-Pneumatic Systems	198
Pipe, Spellerized Steel	96	Three-Way Force Pumps	46, 48, 65, 68
Pipe Cutters and Die Stocks	107	Thresher Tank Pumps	114
Pipe Vises and Wrenches	107	Triplex Mine Pumps	154-157
Piston Pumps, Hand and Power	164-174	Triplex Power Pumps, Single Acting	154-161
Piston Pumps, Horizontal Double-Acting	164-174	Triplex Deep Well Power Pumps	186
Piston Rod Roller Guides	102, 186	Triplex Pumps for Hydro-Pneumatic Service	197
Pitcher Spout Pumps	12, 14	"Triumph" Double-Acting Force Pump, Hand	112-113
"Planters' Tractor" Sprayer	205	"Triumph" Double-Acting Piston Pump, Power	170-171
Plungers for Cylinders	79	Vacuum Pumps	135
Plunger and Valve Leathers	92-93	Valves, Check, Foot and Float, Iron	101-102
Plunger Pump, Hand and Power	211	"Vermorel" Spraying Nozzle	214
Pneumatic Pumps	135	"Victory Junior" Power Sprayer	212
Power Pumps, Single-Acting, Triplex	154-161	"Victory" Power Sprayer	213
Power Pumps, Double-Acting, Horizontal	164-174	Vises, Pipe	107
Power Spray Pumps	211-213	Water Systems, "Marvel"	190-191
Power Spraying Outfits	212-213	Water Systems, "Climax"	189
Power Working Heads for Deep Wells	72-75, 176-185	Water Systems, Deep Well	194-196
"Premium" Hand Force Pumps	40	Water Systems, Hydro-Pneumatic	189-196
Pressure Regulators for Electric Motor Circuits	110	Water Works Pumps	154-161
"Prize" Bucket Sprayer	200	Well Lift and Force Pumps, for Hand	32-48
Pump Bracket, for Sinks	103	Well Force Pump Standards	53-55
Pump Heads, Deep Well	177	Well Lift Pump Standards	51-52
Pumping Jacks	136	Whitewashing Outfits	128
Pump Leathers, Oak Tanned	92-93	Windmill Connections	109
Pump Rods, Steel and Wood	98-99	Windmill Force Pumps on Base	121
Pump and Cylinder Valves	80-81	Windmill Force Pump Standards	57, 59-68
Railway Water Supply Pumps	154-159, 170-174	Windmill and Power Irrigating Cylinder	91
Rams, Hydraulic	132-133	Windmill Lift Pump Standards	56, 58
Repairs or Extra Parts	217-238	Windmill Three-Way Force Pumps	65, 67, 68
Relief Valves	109, 216	Wing-Valve Pumps, Oscillating	24-25
Rod Couplings and Steel Rod	98	Wood Sucker Rods and Pin Connections	99
Rods, Wood Sucker and Connections	99	Working Heads, Deep Well, Geared	178-185, 73-75
Rotary Force Pumps, Hand and Power	139-147	Working Heads, Deep Well, Triplex	186
Rotary Gasoline Pumps, Automobile	145	Yard Pumps	32-48
Rotary Oil Pumps, for Lubricating Machine Tools	147	"Y" Discharge Connection and Stop Cock	215

Index to Figures

Articles in this Catalogue are generally designated by a Figure number. This Index should be used when the Figure number is known; otherwise the Alphabetical Index, preceding, should be used to find description and list when the name is known.
